From: Roland Whitsitt
Topic: 1 Message: 1

Welcome all ye AT Sprint enthusiast! I was suprised to find there wasn't already a group for this rig, so I started one. Now we have a watering hole to gather, share ideals, give the founding guru of this rig ideas, get help and to share our adventures.
Roland N5VWN/6

2. Hello to the new ATS-3 Group

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-06-10 19:37:10 UTC
From: n1ksn
Topic: 2 Message: 2

Hello everyone. My name is Andy N1KSN and I am an ATS-3 owner.

Funny that I got the invitation today, because just this morning I
was "town park portable" with my ATS-3. My setup:

ATS-3 at 3 watts powered by 8 AA NiMH 2500 mAh cells
Rig housed in Altoids tin
KD1JV SWR/Power meter, also in Altoids tin
Elecraft T1 autotuner
85' wire configured as inverted L, held up by two Sunnyday 20's
Three counterpoise wires, cut for 40, 30, and 20 meters

The bands were not great, but I answered a weak CQ on 14.0397 MHz and
met Brian KB9BVN, who was MOBILE with an Elecraft KX1 and a Hamstick,
also running 3 watts! I got a 459, I gave him a 569 with QSB. He
was about 350-400 miles away near Terre Haute, IN. You don't get a
contact like that everyday.

I am very pleased with the ATS-3, and am thinking about getting an
ATS-3A so I'll have two.

Later,
Andy

Hi Andy, I've been thinking of getting one of those T-1 tuners. It would also go good with my 817 for "the other bands". What's your impressions of that tuner? Did you get the kit or the ready made version? Thanks for posting!

4. Hi, my name is John, and I am an AT Sprint-aholic

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-06-14 14:28:16 UTC
From: John A. Evans - N0HJ
Topic: 4 Message: 4

Greetings All,

I own an ATS (Mark I?) that has been my primary backpacking rig for some time. I built the rig and a tuner into a pencil box, which also stores some accessories. I also owned an ATS-2 but never assembled it, finally selling it because I wasn't happy with the packaging/interface. I also own an ATS-3 that I am about to assemble and I will most likely buy an ATS-3A.

The current plan is to build the ATS-3(a) into a case made of two metal pencil cases. I've epoxied the two pencil cases bottom to bottom and will house the ATS-3 into the top left portion, antenna tuner into the top right portion (perhaps with part of the tuner recessed into the bottom as well). The bottom will house batteries. Both top and bottom should also house accessories as well. At any rate, I will mount the pushbuttons on the opposite side of the ATS-3 board as instruction so that there is no need for access the ATS-3 from both sides - this is just the way I prefer.

I haven't decided on a tuner yet but am looking at the ALT as well as the Fuchs Antenna Tuner. If I get to it, I will post a picture of the tin setup.

72 - john - n0hj

Hi Roland,

Well, I am not Andy but I do have the T1 (as well as several ATS rigs). Bought a T1 kit early on and have been using it ever since. It matches quicker than my KAT2 in my K2 (it is an older K2 so that may explain why). I don't see how they can sell the built T1 for what they do -- it is an absolute bargain. Either kit or built you won't go wrong.

6. NK0E checking in

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-06-14 14:51:53 UTC
From: David Ek
Topic: 6 Message: 6

Thanks to Roland N5VWN for starting up this group. Thought I'd check in. I'm Dave NK0E and I built and own an ATS-II. I'm somewhat chagrined to admit I haven't actually put it on the air yet, other than for testing. I haven't actually put much of anything on the air lately because my shack is mostly packed up and in storage right now while I complete a couple of moves after having gotten married a couple of months ago.

My ATS-II will see mostly portable operation with my Elecraft T1 and probably a half-size G5RV that I drag around with me.

One suggestion would be for someone to upload info to the AT_Sprint group home page on the firmware enhancements that one of the QRP-L members made for the ATS-II and ATS-III, along with some information on how to reprogram existing rigs. I have that stuff someplace, but right now I'm on the road traveling and don't have any access to that stuff. I'll do it if I get a chance once I have some time back at home again.

73,

Dave NK0E

Hi Dave,

Hope you get that ATS2 on the air soon.

For the firmware modifications, please check out my
website (yeah, I'm the guy) at:

<http://w1mt.qrpradio.com> or more specifically:

<http://w1mt.qrpradio.com/ats3.html>

Btw, a little pre announcement for you guys on this
list, I will be releasing a new version of firmware
that includes scanning capability in the near future.
It will also allow you to change the sidetone/BFO but
only if you have done the NR4E IF filter modifications
as well.

For those who don't know, the firmware mods I have
made support the ATS2, ATS3 and soon the ATS3A. (The
original ATS used a different mpu and thus is not
supported by my firmware mods.)

If someone wants to put a link on the AT_SPRINT page
to my homepage that would be fine, but because the
information is subject to change please don't copy the
site.

8. T1 evaluation and stealth ops

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-06-14 15:31:32 UTC
From: Roland Whitsitt
Topic: 8 Message: 8

Micheal,
Well that cinches it then, I'll sneak in an order for it under the XYL's radar. I've been impressed with my K2's tuner so if the T-1 is better, I'm in. I'm looking for something quick and easy for those times at work on graveyard shift or any shift I can sneak away for stealth operations! I've got a place where I've thrown a wire off a gangplank between two tanks at about 50 feet. I was trying out a friend's kx1 and got someone in Indiana from Californy. On his qsl card the OM said, "I've worked weaker sigs, but not many!" hi hi I was running 4 watts in about 20 feet of wire hanging down and counterpoised on an aluminum railing. So I was happy. I like the kx1 but money dictates another direction. Plus, the ats3a is just one of those things "I have to have!" Like many of us here, I like lots of the neat rigs out there. I even like the idea of making simple tube rigs on a piece of board. But that's something for another forum. Sorry, I do rattle on sometimes.

13. ATS Envy

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-06-15 12:21:29 UTC
From: SteveG /Monument, CO
Topic: 13 Message: 13

Fellow ATS'ers,

Steve/n0tu here. I've been eyeing Steve's ATS for a few years now while using my KX1 for trips to the woods. I guess I was put off by the lack of a tuning KNOB. Recently had the opportunity to 'trail' test an original ATS via John/n0hj. I loved it! Who needs the knob anyway? When a button will do! I especially like ATS's 4-pole verses the KX1's 3-pole!

So, I've jumped in w/both feet and ordered a ATS3a. as you can guess I'm impatiently waiting for shipment. As far as ATUs -I've several homebrew LC wire tuners & ZM2. ATS packaging remains a creative option at the moment. Glad to find ATS kindred spirits forum!

Topic: 13 Message: 14

Steve,

I too am waiting for the 2 ATS3A's that I have ordered. One for me and one for a friend...who does SMT work for a living. He is going to teach me how to do this work better than I have in the past. I also have the KX-1 and have been having a blast with it and plan on taking it for a trip on Saturday to celebrate International QRP Day.

I also had a chance to play with a couple of ATS2's and found the receiver to be very hot...and after a short learning curve to figure out the switches it wasn't bad at all.

KD1JV does a fine job of kitting these things. I have yet to decide what type of enclosure to use...but there is time for that. My concern is the creation of the holes in a tin such as an Altoids tin without distorting the metal...any suggestions.

72,

Hi Jeff,

Suggest you use a step bit (also called unibit) and go
slow. These bits work great for altoids tin type hole
making.

Yes, the manual you get with the rig will have a
template in it. If you can figure out how to get your
printer to print the image and not let it (the
printer) do any resizing you are good to go.

21. My story (very long history of man story!)

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-06-16 15:22:13 UTC
From: Roland Whitsitt
Topic: 21 Message: 21

The ATS3a is due for release in 3 days! Just in time for field day? I doubt it. But that's okay. My friends are making me do qro this year. At least we will be in Lake Tahoe! Hope to work you guys.
Last year my k2 was still in assembly and I was dead in the water trying to find a poor solder joint. For SKN night I had the k2 but after a couple of contacts with a SW+ couldn't get anybody qrp and not even with the k2 at 15 watts. Ended up using an aging DX70 alinco that's seen to much marine use. Now at least I've got the k2 upgraded to 100 watts for "those days" when I want to operate no matter the band conditions. Also got a really beautiful Spanish Llaves straight key instead of my $8.00 one for SKN or whenever the mood hits.
Lately I've been using the SW+ a lot with a fcc-1 digital readout.
Now for the confession. I don't yet have an ATS yet. I gleaned the internet on this rig. I was between the kx1 and the ats3. My XYL was balking at the expense of the kx1 and to be honest, not having that 5th watt put me off. I want every watt I can get and still be considered qrp. I sure like the packaging for the kx1 though.
Anyways, not only the 5 watts but the total band coverage is what sold me on the ats3. Of course there is the "neat" factor with the ATS.
When I built the k2, I had a support group. I didn't see that here, (I did not yet know about the qrp-l group). Now, I've got a group to help me through the project. I have built a small kit from Steve before. I built the audio filter for the rockmite. The rockmite was fine, but sometimes was just to much a challange and I wanted to have a bit more of a qso. Was cool getting a rockmite to rockmite contact though.
So now everything is in place. The hamshack is straightend up for the next project. I've got my doofis tool made and ready for action. The support group is here. The kit is just about ready to be shipped out and Steve had my check in hand about the time this site when live.
I'm sure if I get the ats going, it will be my main rig for quite some time. I say that because I found myself using the SW+ most of the time before, with the ft817, k2, rockmite sitting idle. BTW, I had my SW+ running 5 watts.
I was going to go ahead and get the T-1 tuner but now have decided to wait and see how the ats3a comes along. In the mean time I can use the norcal blt tuner for 40/30/20. I guess you can tell by now I'm into building kits! I've never been able to make any of Dan's small parts kits to work, and I have them all. And every one of his kits had missing parts. But he was prompt. Still have the little joe for 10 meters I haven't built. Going to try and make a 10 meter beacon with that using my norcal keyer.
Let me back up to the beginning. My first attempt at kit building was the dreaded pixie II. I never could get a random contact with that rig, only a prearranged one. My friend got one from a guy 70 miles

away. He got his qso on the second call! I tried for a couple of weeks. And now I've evolved to the ats. Hope nobody is put off that I started this group and don't even have the rig in hand. I'm already a fan. And I wanted a group here for others to find easily. I'll be attentive to this site as I want it to grow. I'm sure it will be a help to builders and free up Steve so he can work on other neat projects down the road. BTW, I'd pay even more for a higher band version. I've been hearing beacons on 10 meters quite a bit lately. My favorite band! As time goes on, and I see who is helping others a lot and level headed, I'll make a couple of other moderators. If and when Steve Weber joins us, he get's instant moderator rights and since this is really his puppy, he can have ownership if he wishes.
Right now, there are no rules other than to behave. Pretty much common sense. Steve has the power to disolve this group anytime. Although anyone can start another one. Hard to put out a wild fire!
Hope you enjoyed the novel. I'm looking forward to writing all my future adventures about the ATS3a someday. Already daydreaming about it!
73's and happy coming field day
Roland N5VWN

Topic: 21 Message: 22

Thanks for starting the group Roland! Long needed. You
will enjoy the ATS once you get it built and on the
air.

Comment about putting higher bands and ATS rigs. Steve
uses the DDS to directly turn on and off the 2n7000
finals (essentially using a square wave) -- as such it
can't go higher than the DDS chip can generate which
is in theory about 50MHz divided by 3 or 16.6MHz. The
ATS2 and ATS3 use 40MHz oscillators so it is a small
stretch for 20M on those rigs but it is close enough
to not worry about. I for one am glad he chose a 50MHz
osc for the ATS3A. With a little firmware change the
older rigs could be fitted with a 50MHz oscillator, if
wanted.

The DDS chip in the ATS rigs (AD9834) could be used on
higher bands if the transmitter part of the rig were
revamped a little. A frequency doubler in the right
spot could make this work. Have a look at the KX1
schematics compared to the ATS rigs and you will see
the transmitter differences. Steve really hit upon
something slick when he put this puppy together.

Btw, I am down to 1 ATS rig in house. Anticipating
arrival of the 3A.

Ditto on Mike's remarks Roland. I don't own an ATS yet...but after playing with one, I ordered two from Steve. One for myself and one for a friend. The theory here being that he can teach me a bit about working with SMT...and hopefully he will be back on the air after not being on the air in about 20 years.

I am looking forward to the project and have ordered a DK9SQ fishing pole antenna from WA3WSJ.com for it. They both should arrive at about the same time.

Thanks for starting the group. Lets try and keep it going and share as much as we can with one another.

72,

24. ATS 3 output

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-06-16 16:57:36 UTC
From: ron
Topic: 24 Message: 24

I get only 2.5 watts out with my ATS 3. It is
touted as being a 5 watter.

Anything I need to do to meet that or at least 4.5??

Ron, wb1hga

Wasn't there an issue with the 2n7000's and shorting of the leads to ground due to the transistor being forced into the mounting holes?? I can't recall if this was with the original ATS or the -2, or -3. Might look for hair-like shavings off the main leads.

Good.

Next make sure that the rig's power source is 12v and
does not drop when transmitting. Then, as another
poster said, visually check around the 2n7000's to
make sure that there are no shorts. Also, check the
voltages around Q5 and make sure everything is as
expected there.

Btw, my rigs have always gotton somewhat under 5w (4.4
to 4.8) depending on band.

Steve once told me that he really designed the rig to
put out 2.5 watts at 9v. So if I get reasonably close
to that spec, I don't worry too much about power at
12v. (Normally I don't run mine over 11.1v anyway -- a
3 cell lipo battery).

29. It's okay to sell stuff or offer building services here

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-06-16 21:46:23 UTC
From: Roland Whitsitt
Topic: 29 Message: 29

Thought I'd mention that. It's not been a problem on the elecraft list or other list I've seen. So if you got a Sprint or any radio gear you would like to sell, feel free to offer it here. Also, some folks like certain rigs but don't have the sharp eyes (and this rig stretches THAT point!) or steady hands. So it's okay to offer building services. Seems to me that this rig is ideal for even blind hams. . .as far as operating.

From: n4eo
Topic: 30 Message: 30

My ATS-3 is with me in HL9 land.
I'm at Yongsan, in central Seoul at the HQ of the 8th Army
and the 121 General Hospital, where I am TDY for 54 days.
I will be attempting to get license here early next week.
I hear a ham works in S-3, where such things are done.
I will be attempting to load a wire dropped out of 9th floor
window at the Dragon Hill Lodge (on post) and tuned with the
ALT tuner (www.qrpkits.com) and running about 3 watts.
I forgot my paddles so I am looking for a ham store,
but no luck in making contact with anyone on the ground
who has such knowledge yet.
With 6 millions souls in Seoul, I'm sure to find a paddle!
72,
Jerry N4EO/KH6, now HL9?? I hope.

So what's the doofis tool? Am I a doofis if I try to build my ATS3a with out or with one? How important is the doofis factor when it comes to ATS build? Are there any side effects from using the tool? Like droopy solder iron tip or limp solder syndrom? Undale to flux properly? Please advise! Steve/n0tu

Ha! I resemble that remark. Actually, I did use my
fingernail on the first ATS I built. Have since
"graduated" to tweezers. Found a nice set at Harbor
Freight and they have worked great for me. The one
that has an almost 90 degree bend at the end works
well for me.

36. Building a graphite enclosure and a doofus with photos

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-06-17 16:24:38 UTC
From: nn4cw
Topic: 36 Message: 36

Folks,
I just uploaded photos of my lightweight ATS3, Skinny Minnie, and a photo of my doofus. My doofus is made from a coathanger, fishing weight, toothpick and wine cork. The wire is bent back after passing through the cork and hooked back into the cork to hold it vertical.

She's dressed in silk and carbon fiber veneer. Full station weight with the 7.4V 300 mAh lipo is .143 lbs. running 2+ watts. With the 11.1V 300 mAh lipo, she's at .160 lbs. and 5 watts out. These weights are with 40 and 80 meter front end boards, respective battery, single earbud and straight key. I used the matt finish Dragonplate which is $18.00 from www.dragonplate.com for a 6 x 12" piece. The 6 x 6" piece which is sold for under $10 would have been more than adequate. The connectors are JST for antenna and power; no jacks are on the board for single earbud or key which are direct wired. Compared with 1/8" balsa that W1MT uses in his lite rig, the Dragonplate veneer is 15% lighter. I used less than a third of the piece in the project. The veneer thickness is all you need for the ATS3. It is tough stuff but easy to work with. I cut it with sharp scissors, evened edges with sandpaper, and glued it up with 5 minute Z-poxy which I use for fly tying and costs $10 for 4 ozs. It lasts for years in its two 2 oz. squeeze bottles of resin and hardener. (Don't waste your money on the 5 minute epoxy that comes in those messy, hardly reusable twin plungers. For purposes of this project, you do not need to buy the expensive epoxy recommended by Dragonplate.) I tightly covered the ATS3 board's edges with masking tape before epoxying the sides directly to the board. No epoxy touches it so that one can easily strip off the dragonplate and rebuild the radio later should one desire. Mounting the sides directly to the board contributes to the stiffness to the enclosure. The finished enclosure is plenty stout.

After the epoxy set up after putting on the sides, I squared everything with masking tape on the outside corner edges. Silk is the strongest, lightest natural fiber. I then made a tape out of silk soaked in epoxy which I applied into the corners and forced into shape with a toothpick. The masking tape on the corners also prevented epoxy seepage to the outside, keeping everything relatively neat. When the epoxy set, I added small strips of Dragonplate to form triangles with the corners to support the top piece of Dragonplate. For the bottom, I printed out page 24 of Steve's instructions and with masking tape, fastened .1" wide strips of Dragonplate just inside the board template on page 24. I fastened the strips together with short pieces of Dragonplate and epoxy at the corners. The silk was fastened to the frame with a

glue stick and then epoxy. I pressed the frame and silk between two sandwich bags until it cured. The finished bottom has enough flex to wedge itself in place in the bottom of the enclosure. The straight key was made from a piece of a flyrod tip and .125" hollow graphite (carbon fiber) rod from Dragonplate. A 40" piece cost $4.50.

The two pieces of tube are fastened to the front of the key with epoxy and a strip of silk. The tubes are separated by 1/32" thick birch plywood. The silk used through out project is from an old necktie. I didn't have the heart to mount the ugly ole' key on top of the radio. The Dragonplate has an interesting look and changes appearance when viewed from different angles. I made all but the largest of the holes in it with the tip of an Exacto Knife used like an awl.

[note: since writing the above description, station wgt. has reduced significantly with 250 mAh batteries.]

72/73, Gil NN4CW

37. Operation from steel building

Date: 2006-06-18 02:45:01 UTC
From: n4eo
Topic: 37 Message: 37

I haven't operated from a steel building at height since
college days when we loaded into window frame and worked Europe from
friend's dorm room at Vanderbilt U. in Nashville.

I'm on 9th floor (top) of Dragon Hill Lodge at US Army post in Seoul
and have the ATS-3 and ALT ready to go.

Will try a wire hanging from the window (it cracks open about 3 inches)
and have a five foot bamboo pole to give me a little offset.
Where is my Crappie pole when I need it?

We'll see how it goes- hopefully I can get a license tomorrow (Mon).

http://groups.yahoo.com/group/AT_Sprint/cal

Run for the Bacon
Sunday June 18, 2006
6:00 pm - 8:00 pm
(This event repeats every month.)
Event Location: Your shack or anywhere

Notes:
This Sunday evening, the Flying Pigs Amateur Radio Club International
will be holding its monthly Run For The Bacon. This is a friendly,
two hour QRP CW Sprint, which is open to ALL radio amateurs, will last
from 9:00 - 11:00PM EDT (0200-0400 UTC Monday).

You may work stations once per band on 160, 80, 40, 20, 15 or 10
Meters. Suggested starting frequencies are 1.812, 3.562, 7.044,
14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs
membership number. If you're not a member of the Flying Pigs, and
would like to be; then please cli

Set up birthday reminders!

Date: 2006-06-19 14:32:27 UTC
From: Michael Harnage
Topic: 41 Message: 41

I have updated my website with new firmware for the
ATS2, ATS3 and (hopefully) the ATS3A. The new firmware
adds support for the ATS3A, scanning capability, and a
button paddle mode. The ATS3A compatibility should
work but I won't know for sure until I actually get my
ATS3A. :)

For more information check out:

<http://w1mt.qrpradio.com/ats3.html>

For scan mode:
<http://w1mt.qrpradio.com/scanmode.html>

For button paddle mode:
<http://w1mt.qrpradio.com/buttonpaddle.html>

How difficult is to upload the new firmware to ATS? before built?
Steve.

Hi Steve,

Not difficult at all. I have reprogrammed my original ATS3 rig literally hundreds of times. All the instructions are on my website.

It can be done on the chip before building (need the TI FET debugger) or

it can be done to the rig after it is built (using either the TI FET debugger or the cheaper Olimex JTAG cable).

You can do it yourself with about $25 in parts (an Olimex JTAG cable and a little wire and few connectors).

Quite a few folks have gone the Olimex cable route and that is what I recommend. This is almost as cheap as postage to and from me to do it for you.

For those who have do not have a rig built yet, I recommend build it as is and get used to Steve's firmware first. Then after reading my website, if my firmware appeals to you, try it out. You can always go back to Steve's if you want.

Hey Jeff and all,
I was just telling my XYL what a special day it is. Our radios are due to be shipped! I'm all excited. My wife wishes I was excited about our annivesary yesterday. hi hi She has been rolling her eyes up at my every mention of it, it looks like she is going into a sezure, every time I mentin the ats.

The gentleman in J-3 who issues licenses is on leave.

But the ATS-3 was hearing all over during weekend Asian cw contest.
Listening on 40 meters, following stations heard:
UA0,HL5,DS1,scads of JA's
K7QQ
K6BZS
KH0N
KH7A
K8IA
Operation on 40 meters is below 7.025 by regs here.
All 20 meters is available.

I've been trying to get licensed in the Philippines and it's been tough. I think most of the folks I've run across have just been signing with a /DU1 or whatever. I'm tempted to do the same. The hang up at the moment is they want a letter of good standing from the US Embassy in Manila. They don't want to do it because they don't have that form. Philippine's way isn't the US Embassy way. Then if you can get that, it's at least a 30 day wait. I won't hve that kind of time. You know, you try to do right but if they make it impossible, well, I know they don't have the resources to do anything about it. I'm still trying to do it thier way right now though.

Reminder from the Calendar of AT_Sprint
http://groups.yahoo.com/group/AT_Sprint/cal

Field Day
Saturday June 24, 2006
All Day
(This event does not repeat.)
Event Location: Anywhere, best in the great out doors with friends!

Notes:
This is a big one! K6WAY, W6YGZ, N5VWN will be in Lake Tahoe (SV, Eldarado County, Ca).

Set up birthday reminders!

When I saw the thin box in the mail, I got a lump in my throat. Then
I saw it was for my wife. Palates cd or something like that. At
least I will be busy with field day the next few days.
Still, I wait with baited breath! Like a kid waiting on Christmas.
I'm 47 for goodness sakes! Even when I get it, I still got to
assemble it and make it work. Anybody know some good mojo spells? Oh
well, I got the rockmite and k2 to work. But this is a different
animal. I'm already fretting over soldering U6! hi hi
Roland in Stockton, Ca. 106 degrees!
looking forward to Lake Tahoe

Hey gang, I just ran across this on eham.net. Our own AE5X posted a neat story here: http://www.eham.net/articles/14090
Although he used the kx1, it's still an excellent read. Anyways, I think the kx1 is also a great rig. Of course I would say that being a k2 owner.
Anyways, read his story! John also has a good website that has some excellent info on the ATS3. It's linked from KD1JV's site. Here is the link http://www.ae5x.com/ats3.html
On another note, I had a fabulous field day with two of my friends up at South Lake Tahoe. It was nice to escape the 106 degree heat of Stockton, Ca for the 87 degree of the campsite. We even had a cloud come over us and the temp dropped to a cool 77! Made a lot of contacts (for me anyways) and just generally enjoyed the time. No surprises, everything worked. We really didn't rough it as the campsite is IN town. A subshop within walking distance. We managed.
Good to see the ats3a's are arriving already. I'll be looking for the mailman on Monday!!!!!!!!!!!!!!!!!!!!

56. 3A board complete

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-06-27 23:23:42 UTC
From: w1mt
Topic: 56 Message: 56

Had an extra two hours today and finished up the main board of the ATS3A. Works FB so far. Now to complete the filter boards and see if it has power out. :-)

Some hints:

1. Make sure you read the manual - U12 is not positioned according to the board layout -- the manual is correct.

2. If it is your first time building one of these ATS rigs -- pay close attention to which side of the board the parts attach. Most are easy, but a few might be tricky.

3. Put the 2n7000 mosfets in after putting the diode in on the opposite side of the board. (D3 I think). Otherwise you will have to bend the fets up a little to insert the diode. Doh!

After putting the filter boards together it will be time to flash the mpu and put my firmware on it for testing. After building the 3A and looking at the schematic I believe that my firmware will work just fine.

Good Luck with yours!

-mike/w1mt

From: DOUG PHILLIPS
Topic: 59 Message: 60

Jackie,

I'm going to guess you have a solder station, magnifying lamp/head visor/stereo microscope already. You just need the ATS-3A and some Altoids tins, I took four tries with my ATS-3 to get it into a tin, you may be a better metal worker than I am. For what it is worth, I think the ATS-3A is an easier build, I have the board done and am working on winding the inductors now.

When Doug Hendricks gets back from vacation order the ALT kit from him (Altoids Long Wire Tuner).

>but what else should I add to my order?
>Any and all suggestions would be helpful.

Jackie,

Doug has some excellent ideas. Please also check out:

<http://kl7r.ham-radio.ch> goto the ats3 page

and

<http://www.ae5x.com/ats3.html>

for more hints at contruction, etc.

I agree with Doug the ATS3A is easier to build the
main board then the ATS3, BUT the filter boards are a
little harder (I don't like 32 gauge wire :-))

Have fun with it,
Mike/w1mt

64. 3A Board Build

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-06-29 10:56:33 UTC
From: Jeffrey Embry
Topic: 64 Message: 64

Hi all,

Got over to Dave's (WA3OFF) last night and got most of the
semi-conductors on the board. This has been my first experience with
SMT and I gotta tell ya, that the water-soluable flux that Dave uses
is some great stuff. Got all the semi-conductors mounted on the top
of the board in about an hour and 45 minuted as Dave was training me
on the use of the stuff. I am sure he could have done the job that I
did in less than 1/2 hour.

This evening I will be getting more of the components on ... and
hopefully will have the whole kit built and tested by the Spartan
Sprint on Monday evening. If it isn't ready I will be on the air with
the KX-1.

BTW Dave did an absolutely beautiful job on his ATS-3A and listening
to W1AW on 80 meters last night with a small piece of coax and very
little antenna told me how hot the receiver is...and I am really
looking forward to that. Additionally, the set of paddles he made
with circuit board material really looks cool.

Time to get to work. Hope everyone has a great day.

72,

I saw Steve's strong suggestion about not using liquid flux. Perhaps Steve's warning was referring to liquid rosin flux, I don't know. After trying to solder the first pin without it, I decided to go back to the water-soluble liquid flux and solder, Kester 2331-ZX and #66/331 (http://www.kester.com/en-us/products/prodcat_detail.aspx?pid=47) and PACE mini-wave soldering-iron tip I've been using for years for surface-mount assembly. I have a lot of practice at cleaning this stuff, and it seems to wash away very nicely, so I figured I would take the chance.

I left off the buttons, crystals (I was concerned about cleaning the tight space between the crystal bottoms and the board), the BFO cap CT1 and of cource, L3 until after the wash. For washing I did a double hot-water spray (kitchen-sink sprayer) and compressed air drying, followed by a rinse in 91% isopropyl alcohol and another compressed-air drying. Compressed air was from an unrestricted blow nozzle at 90 psi. I don't think I would attempt to use the water-soluble flux for this project unless I had a good source of compressed air to get water out from under the components.

After the wash I switched to the kit-supplied solder for the remainder of the assembly work. I've seen nothing to suggest any flux-related problems. Whether it's luck or skill, I can't say, but the rig seems to work flawlessly.

I think Steve recommendation comes from some of the
rework he has had to do.

Confession time -- The last two ATS's I have built I
used a Kester Flux Pen (exact part number escapes me)
followed with an acetone/toothbroush wash. Works fine
for me BUT your mileage may vary. Never even had to
remove solder bridges from the DDS chip. Stuff works
great. For me. Given Steve's warning, use this method
at your own risk, though.

I want to try the warming pad/embossing gun/solder
paste method next. Maybe build another smt dummy load
to test that method. For more information on this
method see:
<http://www.zianet.com/erg/SMT_Soldering.html>

In a lot of ways I think smt work is much faster and
easier than thru hole contruction. If only my eyes
will hold out!

OK gang,

Just powered up the main board and got the sweet sounds of 20m, made lots of dits and dahs, something around 20mA of draw at 9VDC, and all smoke was retained. I have the 20m board done and am working on the rest, maybe it will be operational for Salmoncon/Lobstercon, if not the ATS-3 will be there anyway.

Doug,

No, I don't have any of those things. I have a soldering iron. All this is very new to me and I want to do it right. I have put together a lot of things, but electronics haven't been on the list -- until now. The magnifying lamp/head visor I can find. Would you mind suggesting a solder station? And a stereo microscope? I have plenty of Altoids tins (I saved them for a friend but he had enough so I've kept them here). I'll ask Doug Hendricks about the ALT kit. Like I said, this is all new to me and I'm excited to jump right in. Would be nice to have a partner, but I'm used to learning on my own. ;-) Thanks for all the suggestions and I apologize in advance for all the questions I'm going to ask (and warning you, too).

OK Jackie,

I use a 3x lighted magnifying fluorescent lamp, Circuit Specialists Hakko knockoff temp controlled soldering station ($35), sometimes a Weller 25w iron with a fine tip, and Steve supplies all the solder you will need. I also use Radio Shack .015" dia. silver bearing solder. You might want to get a large aluminum baking pan to use on the project, the sides will keep all the little SMT parts corralled, I have lost a few to the floor and cats over time. The web sites Mike gave are excellent resources, there are a series of articles on the ARRL web site on SMT construction and lots of good info in the Homeberwer Magazine CDs (still available from AMQRP).

If this is you first attempt at SMT construction, I would recommend a couple of the small SMT projects from NorCal, dummy load and tuneruppers. Steve also has a digital dial project, which would be a good one also for practice before starting on the ATS-3A.

The only really tough IC to solder is the AD9834 DDS VFO. The hard part is getting is aligned to the pads on the PCB, once that is done, double check to make sure all the little feet are where they belong and tack down the four corners. Once you are sure you have the chip sited OK solder the rest of the pins and don't worry about solder bridges. When all pins are soldered take some solder wick, apply the tip of your iron to the wick and draw it along the pins of the IC. The wick will remove the solder bridges and you are in business.

Keep you questions coming, this group is a good resource for info and tips.

Happy Sat nite for me.
ATS-3 thru ALT to 51 foot hanging wire 3 feet off bricks at 9th story, with 11 foot counterpoise dangling against the bricks..... and very sharp tuning for great match.
Using bamboo yard lantern pole for my offset of 3 feet (bamboo in S.E. Asia, yesiree!)
TALLY- N6RO, 4 JA's, one Korean station- HL1/N8HI (Frank) all on 40 meters.
Broadcast QRM stiff to say the least, and found copy was better with ALT in tune mode for receiving (seems to be about 20 db attenuation, more or less). Great little boxes containing no RICE!
ATS-3A supposed to help the blasting my ears got from SWBC tonite.
Can't wait to hear how it's working thru the SWBC crud for the Europeans.

I found the same using the Emtech ZM-2. I later added a 2700 ohm SMD
on the back side of the 40m module to always add attenuation on 40m.
I was using a 180' doublet up 80' and the BCI RF was just too much for
the stock ATS-3.

> ATS-3A supposed to help the blasting my ears got from SWBC tonite.

Hi folks,

This morning while putting the caps on the board, I accidently grabbed the hot part of the soldering iron burning my thumb and two fingers (nicely blistered now). So...I thought I would send out a little reminder to hopefully keep this from happening to others. This will probably set me back a week or so...but the ATS-3a will get done before the Spartan Sprint for August.

Be mindful of your surroundings and keep safety first and formost while putting this rig together.

From: ARCHIE LAMB
Topic: 84 Message: 84

(Sorry this is long)
A note of caution is in order here:
LiPos are potentially hazardous if not handled properly. I have quite a few (and use them regularly in my RC airplanes). You MUST have a "real" LiPo charger - not a Nicad or the like. They CANNOT be fast charged. To get them to full charge from pretty much drained is 2 to 4 hours. The good thing is that you can tell the charge state by measuring the terminal voltage. 3v(per cell) = discharged (lower risks permanently damaging the cell) 4.2 is pretty much fully charged and its fairly linear in between (I carry a graph when I fly to tell how much is left in the battery).
The stories about fires and explosions are worst case scenarios but NOT just urban myth. I know people like to exaggerate and tell a good story but I know a guy who destroyed his car and another who severely damaged his kitchen - those guys are idiots! right? well I didn't see their certification papers but they do seem aware enough to come in out of the rain. Seriously, accidents happen and these things CAN be dangerous. You've probably quit reading already but I suggest a "charging safe" - I use a cheap document safe modified to allow the charge cable into the box. Then I'm comfortable to walk away from the battery charging.
Have I ever had a battery erupt into a fireball? No. Have I ever had strange behavior? yes. I had a couple puff up to the point that I was not comfortable using them any more. Were they going to erupt into a fireball? I dont know but that is the next step (supposedly).
I have seen the chargers go from $29.95 to over $300. Most RC hobby stores will have both the batteries and chargers. There are lots of brands - Thunderpower has been mentioned and its a good one (their energy density is very good!)

From: Kurt Loken
Topic: 85 Message: 85

Well...it works. I lost a 0.01uf cap, so I had to use a ceramic disk replacement for now...kind of looks like an out of place wart on this board...hi. Other than that there were no problems in the build.

I fired it up last night. I have only built the 30M band module so far, and 30M was pretty quiet for the short time I was on last night...so no contacts yet.

My watt meter shows I'm putting out 5W at 12V, and the receiver was nicely picking up the few folks that were on-air last night on 30M when I was on.

The interface is well thought-out on this rig, in my opinion. I just want to say that this rig is a truly a joy to control; I very much prefer the buttons to a knob for tuning. It must be all the video games I've played or something. The direct entry of freq from the paddle makes large moves in freq quick and easy. I also love the being able to do things like quickly flick the Rit button and have message 1 play. I expect this rig to become my workhorse.

Now I need to finish my other band modules, but so far so good. (I have all the toroids wound, but I just need to mount them. ...and I thought the NC2030 had a toroid from hell...this thing has many from the same circle of hell.)

I also need to get the darn thing in the Altoids case. If someone on here offered pre-drilled Altoids cases for the ATS rigs, they would make a buck or two (at least from me).

Regards,

Kurt - ae6uj

86. 7812 Power supply step down for my ATS-3A

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-03 16:02:29 UTC
From: Kurt Loken
Topic: 86 Message: 86

Hello All,

Just thought I would let folks know of the method I'm
using to get 12V out of my 13.8V power supply for my
ATS-3A.

I used a 7812 voltage regulator and a 1/2 amp fast
burn fuse to step down my voltage. It appears to work
well for normal operation, but I did blow a fuse when
I entered "Tune" mode on the ATS. A beefier fuse may
be useful if you are going to use "Tune" mode (I won't
be using it.)

Let me know if you want any further info on the
circuit. The 7812 is cheaper than even a single 9V
battery, if you want to run from a power supply.

Regards,

Kurt - ae6uj

Topic: 89 Message: 89

Hi,

my name is Petr, OK1RP and I am licensed since 1988. My first novice callsign was OL1BVR then I upgraded class with exchange the callsign to OK1PRR. My current callsign with extra class is OK1RP.

I joined Your AT_Sprint group as I am interested in the ATS radio and even my new baby arrived in OK land few days ago.

In the Files You can find the ATS-3 building instructions manual and also some ATS reviews nor famous filters mods from NR4E. Also I added the RTTY mod as I found on the net. In Photos section You can find also few ATS beauties from net. I hope it should be usefull for all ATS enthusiasts during the building their "diamond"...

72, Petr OK1RP

BTW: does anybody know how much of the ATS (all versions) has been hooked up on the air already? As I did not find s/n so maybe only Steve know it? :) Specially in EU should be interesting as there is much more troubles with SWBC from strong stations.

90. ATS-3A firmware mods

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-04 16:57:47 UTC
From: Dave
Topic: 90 Message: 90

I got the Olimex debugging cable in the mail yesterday, but didn't want to mess up the operation of my ATS-3A until after the Spartan Sprint yesterday, so I didn't try loading new firmware into the processor until today. Seems to work fine from my Win98 laptop machine, but on my desktop WinXP machine I keep getting a "port in use" message when I try to initiate debug mode. Perhaps there is a conflict with the drivers for the other JTAG programming drivers I use for other applications, I don't know. But to rationalize, I think I like having the debugger on the laptop anyway.

I noticed from looking at the original firmware source that there are some quirks in the tuning functions with regard to band limit checking (I guess these checks are not present in the ATS-3, so this is new stuff). Under some circumstances, the original code will allow you to tune up or down 0.5 kHz to 1.0 kHz outside the band and direct frequency entry will allow you to get to some places outside the band as well. So I think I've fixed all of those things for normal tuning mode (I haven't checked anything for split-tuning mode yet) and am testing it now.

Since so far I'm inept at using the keyer, I'm also playing with an added menu function that permits switching on-the-fly between iambic and straight-key modes (straight-key on the Dash paddle). In straight-key mode, dual-paddle operation is still available for all non-transmitting functions such as direct frequency entry. I'm planning on getting a Y cable to allow both the paddles and a computer-controlled keying interface or true straight key to be attached at the same time.

Anyway, thanks go to Mike, W1MT, for his pointers on getting the development environment going.

Dave

Since our backpacking trip on the CT was postponed because of the monsoons moving into Colorado, I decided to 'let the building begin'. 'Gentlemen ...start your solder irons'

The good news is my 3a now has the uP and DDS chips mounted successfully and in the correct orientation! The bad news is I blew up the tip of Metcal iron when adjusting the magnifier lamp with the solder iron in my hand the tip burned accidentally through the lamp cord and shorted to the ac-mains with a loud POP and flash of light! The Metcal solder station is fine and so is the lamp but the tiny tip is missing!!! Vaporized my friends! Gone off the end of the cartridge? Lesson learned -- when not using the iron place it back in the holder DO NOT leave it in your hand. I see DigiKey sells the tips for 22+bux plus shipping (ouch). Since I've got U7 under my belt (pic in file) I may just switch to the Weller WP25 which cost me $30 for the whole works! Those dagum Metcal tips are expensive fireworks!

Just awaiting 4 SIP pins for the filter boards. They were missing
from the kit. I did the first smoke test and was relieved to hear the
"20M"! Did as much as I could do without the filter boards or other
recomended equipment. I've got the tin drilled and fit tested.
Almost got it right on the first try. The next one ought to be it.
The template threw me off with it being "printed side down". hmmm
Can't see it that way. Mostly the holes are close. But the positive
post on the antenna is touching antenna ground so I got to change
that, which means start over. Or live with a ventilation hole. hi hi
Wondering who my 1st qso will be with. It's 4 am and I should be in
bed but I've just been looking at this thing over and over. It's so cool!

From: Jeffrey Embry
Topic: 96 Message: 96

Last nite, with recovering fingers from an earlier burn, I got all the capacitors on the board. Not much left to do. I will do more tonite and tomorrow night and hopefully will be done and on the air early next week.

So far this is a great little kit. Having fun with it...except for the burn I took on Sunday when I grabbed the wrong end of the soldering iron.

That's great!!! My kit was missing the sip pins too,
but I had some already so was able to continue and
finish.

Regarding calibration, if you have Spetrogram, or
Spectran, or baudline (for linux guys) you can do the
alignment with just another receiver, your computer
and optionally a noise generator (antenna works too).
See my website for instructions. It will set you up
dead on both frequency "CF" and oscillator "CO". Once
you get the hang of it you can do it in minutes.
(<http://w1mt.qrpradio.com/ats3calibration.html>)

One note, turning the trimmer cap on the main board
will move the passband up or down -- with the computer
display and a noise generator it is real easy to put
it right where you want it (around 600Hz). Then you
are ready to do the rest of the calibration procedure.
(I will change the website to reflect this sometime
this week.)

Wow, I just happen to run accross this. I'm cut and pasting this from another source.

<<<<Skinny Division Winners -
Mike W1MT won the Skinny division with 22 contacts and an ultra-light .135 pounds. To save weight Mike used the buttons on his ATS3 and no key.

Andy W5ACM took second with 25 QSOs and about a quarter pound. His weight saving this month was lighter earbuds.

Larry was third with his ATS3 and an attic loop antenna. He had 27 contacts on less than a third of a pound.>>>>

That's right folks, our own W1MT won this thing on a microlight ATS3. I'd like to hear his story. And this 3rd place ATS Larry guy. Is he among us? I'd like to hear his story too. Congradulations to both!

Well shucks. You can read the continuing saga at:
<http://w1mt.qrpradio.com/ats3-lighten.html>

Basically, it is a game with specific rules (you can read about them at the Adventure Radio Society website) that a few of us like to play. The score is essentially number of qso's divided by your station weight. Some of us have gotten the weight down pretty low (under 2 ounces for instance). As you can imagine it does not take too many q's to get a high score with a very low weight. Still it is fun and I am at the stage where saving 0.001 pound can help.

Check out nn4cw's photos of his rig in the photo section of the AT_Sprint site. He is using carbon fibre veneer as his enclosure. He is on this list and has won Sprint or two. I believe that N7SR is on this list too and he has won before, too.

One thing you will notice is that to place in the top 3 to 7 places you pretty much have to be using an ATS3 rig (the ATS3A should work fine too). Most of the top guys are using lipo batteries as well.

My antenna is not very good so I do what I can with the propagation given me, but look a few months back to see what k3ese did with a decent antenna and a tricked out ATS3.

104. 40M ATS-3A action

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-07 06:23:33 UTC
From: Kurt
Topic: 104 Message: 104

I made a few contacts on 40m tonight, and I spent a good portion of my time trying to break through a log jam for a guy in Cuba, CO6YVC...a pretty futile effort...but you never know...he was definitely a 599 for me.

I think I can safely say that my ATS-3A is working...and working well. I still need to finish
building the 80m module, but I should get that done this weekend.

I also need to get it in a case. I have decided to avoid the altoids boxes. They are cute, but they are a pain to drill...and the cover hinges wear out quick in my opinion.

I'm going to follow W1MT's lead and make a little wooden box for it. I'll give the box a spray job and maybe even a bit of art work for good measure. I kind of like the mixing of low tech and high tech. If the finished product isn't too embarassing, I'll post a pic here.

Regards,

Kurt - ae6uj

105. Tactile switch information

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-07 12:18:37 UTC
From: Michael Harnage
Topic: 104 Message: 105

Kurt's recent post about packaging the ATS rigs made
me think of this. The button switches that are
supplied with the ATS3 and ATS3A rigs are 6x6x7
tactile buttons. The ones at
<http://www.mouser.com/catalog/626/1184.pdf> that
match figure D are equivalent, if not the same ones,
that Steve puts in the kits. You have your choice of
tactile resistance (I am partial to the light touch
ones -- 100g). Red colored buttons tend to be the
stiffest, brown or black are typically lighter.

If you package your rig in anything thicker than an
Altoids tin or very thin sheet of wood (1/32") you
will need taller buttons. For 1/8" thick wood I would
recommend the 6x6x9.5 size.

If you do replace them on your board snip the old ones
off and remove the soldered legs one at a time from
the board then clean the holes and replace. It is
easier than trying to save the old buttons.

Btw, the ATS2 used the 6x6x13 size buttons.

You'll notice that I, with my ATS-3A (0.3 lbs) and Jeff with his KX1 (1.125 lbs) tied despite my having only 4 contacts to Jeff's 15. Obviously low weight is key and Mike has taken that to the extreme. Next month I'll be in better shape with a 0.05 lbs reduction with my new carbon fiber case ($10 worth of 0.025" carbon fiber plate, balsa bottom and about 7 hours, nearly as much time than I spent on the rest of the rig) and I should be using a Li-Po battery as well. That should bring me to under 0.200 lbs if I use buttons as keys.

From: Kurt
Topic: 104 Message: 110

One alternative to getting taller buttons is to use a large drill bit to recess the wood slightly around the button hole. This would allow the finger tip to toggle the button even though the button is shorter than the box's top surface. Another advantage of this method is that you would be able to have the box turned over and set it down on its top...but not be toggling any buttons, as they would be recessed.

I may need to use this method on my box. I think with the wood I got, the buttons will be flush with the top of the box...so I will need to recess the wood around them a bit. By the way, I bought a sheet of hobby wood (not balsa) for 99 cents...much cheaper than the altoids I would never eat...and, structurally, far stronger.

Regards,

Kurt - ae6uj

Yes, you can change filter boards. Won't hurt the rig. I have done it many times. :) You can tweak the coils and put the same filter board back in to get a little more (or less, I suppose) power out without powering down. Steve recommends this procedure in the manual.

You can even switch filter modules BUT, no, it won't sense the band change. The dds will still be set to the old band while the filter hardware is set for a different band. With my code you could qsy to the new band/freq and continue but in practice I just repower the rig.

The test for which band is plugged in is done once only during power up. Both Steve's and my version of the firmware operate the same for this function.

If one wanted, the code could be altered to sense when a change is made but there are other considerations. Such as, no filter board is sensed the same as the 20M filter board. Also, do you "remember what freqs you were at on the old bands so that if you put an old band back in do you go back to the old freq or act like a power up and reset teh freq to the default startup freq? Probably a few more things too. This would be low on my list of things to do in the code. There is a limited amount of code space and mine is near the limit. My coding for this rig seems to go in cycles, gain some code space by rewriting current stuff, then adding new stuff, repeat. There are a couple of things I am thinking about so I am comtemplating entering the save code space cycle again. :)

Well gang, I hit my first problem. When I power up I do get the cw messages and the menu system works fine. But no audio from stations. I don't hear anything. Also no output power. Haven't even had time to do any trouble shooting as I had to go to work. About all I did was flex the board a bit to see if something loose might make contact and also pushed down a little on all the chips legs. No luck yet. Me feels that maybe me shorted some of those tiniest legs on U8. It could be the two 612s also. Anyways, I'm on this 12 hour graveyard shift right now, so when I get home and get some sleep, I'll do those voltage checks. That may point me in the right direction. The last thing I want to do is send it in to Steven to fix. That would pull the attraction from the rig for me. I'm certain it's a soldering issue. I know I used to much. Wish me luck!

Hello Rolland,

Sorry to hear you are having trouble. It sounds like you hear the sidetone...which is good news. Were you able to do any of the calibration checkouts on pages 20 and 21? You put L3 in too right? (Dumb question...but had to ask.)

I wouldn't be afraid of contacting Steve for help. He has always been quite responsive to any questions I've ever had. Not only is he a design genius, but he is brilliant at debugging build issues too. (I believe he has been the debug guy for SW plus radios too for many years.) Just be specific and complete on your info to him so he can better help. (Or you can take your chances with us blokes here. I know which I would choose.)

Incidently, I usually hook my new rigs to a signal generator before I even put them on air to listen for signals. If I don't hear the signal from a generator, I ain't gonna hear a station. I also prefer using a generator and 0-scope for tweaking the band modules...takes the subjectivity out...but the 0-scope is not necessary.

An adequate signal generator for anything I've ever done is sold by norcal for around 7 bucks...and takes about 15 minutes to build.

http://www.norcalqrp.org/VE3DNLmarkergenerator.htm

Best of luck,

Kurt - ae6uj

Nice to know it is safe. I was powering down the unit when I tweaked the coil spacings...definitely slowed things down. I should have read the manual more carefully...now I see the note on removing the module with the power on to tweak these.

As far as an autosense function...it would definitely be a nice to have but not really a need
to have. I do want to install a switch on my power cable...I expect I'll wear the connector out if I don't...seems like I'm always turing this thing on and off.

Request: If you do add an autosense function ever, I think it would be adequate to just reset back to the startup freq for the band module. An autosense would be nice if you ever packaged the unit with a switch for selecting the different bands (somehing I've been debating in the back of my mind). After winding these evil toroids, I am worried that one day all the handling will cause the leads to eventually fail...requiring me to wind a new toroid. Once was enough...thank you.

Regards,

ae7uj

L3 is a great place to look. I wondered how many might forget to put it back in before moving on to calibration etc. Also, another dumb question but you did have a filter board plugged in, right?

I once have a ATS rig that had no sound so the second thing I did was reflow all the joints in the audio path again with the soldering iron. The first thing was a visual inspection under magnification. The reflow worked.

During the visual inspection make triple sure that all the IC components and diodes are inserted correctly polarity wise and in the correct spot.

My money is on a loose connection somewhere.

From: Petr Ourednik
Topic: 119 Message: 119

Folks,

I added some of usable files regarding the ATS rigs I hope...

You can find the ATS diagramm as I found on the net (older version),
also some of reviews from field operation and finally the mods of
filters etc.

Should be helpful in case of building nor adjusting of Your ATS.

Best regards,

Petr, OK1RP

BTW: did somebody thought about the switching the band modules on-line
w/o changing the modules? (of course solution will not be so small and
light as original t-shirt ATS :)

Yes it has been one of my ideas to do this for over a
year.....

One idea is to put all the filters on one board and
have that board interaface thru the current 7 pin
header. This would mean several relays on the big
filter board (4 at a minimum, I think) and a way to
communicate to the board. Currently two port lines are
available for the board (the same two lines that are
used to sense the current filter boards). A two-line
interface could be utilized to control the big filter
board.

I have never put this together as then the rig starts
getting bigger and more complicated.

Topic: 114 Message: 121

After the visual inspection, yOu might start by assuming that both the receiver and transmitter problems are due to the same cause. Besides the microcontroller and the 5V supply (which seem to be working fine since you hear the sidetone), the DDS chip is the only thing I see in common. I would reallly look closely at the pis of that chip and its three connections to the microprocessor. Check for a valid LO frequency.

Topic: 122 Message: 122

This didn't make it to the group last night - could be an issue with my membership (has happened before). Anyway, thought I'd post online.

Greetings All,

Thought I'd post an update - photo also included in my project tin photo section. I worked on and completed the main board this weekend. Only launched two components - a small cap and small resistor. One landed within my cooking pan tray and the other landed on the concrete basement floor. Luckily I was able to locate both of them.
Also, with the ATS-3, the power connector that came with the kit is not the one the board was designed for (one of those "no longer available" parts), so I fiddled with the tabs to solder them to the main board, adding some strength. I am not sure what the rear of the ATS-3A looks like (haven't ordered mine yet) but the ATS-3 has a small cap from the 12v connection to ground just on the other side of the board from the power connector. If you have an ATS-3, it may be a good idea to wait until you mount the power connector before you mount this small cap - I gorrilla'd the connector and ended up snapping off the cap on the rear of the board. Fortunately, since I did NR4E's receiver mods in conjunction with the initial build, I had a spare cap available.

Also, you will note that I added the older ATS-style pushbuttons to the top of the board - my case (see batman tin photos) is designed so that the board is mounted similar to the older ATS MkI with all button and module access from the top - I will not provide access to the rear of the board at all - underneath, the ATS-3 will house my battery pack (in the bottom tin section).

Finally, I had some old boards from an old Sony TV and they had some nice 7 pin connectors and matching cabling, so I pulled one from a board and installed it as the programming connector. A simple cable adapter from this connector to a JTAG cable will provide for reprogramming the CPU. I may just reverse the button programming, too, so the order matches the standard button configuration.

Next, to the modules and then the smoke test.

I had a scare. My XYL caught my 2 year old son walking around with the raw ATS3a that had been on the bench. (not in the shell) Electro static doom! At least
I was thinking that. But when I put power to it. I could hear it singing the "20M" song. Whewww!

I've gone through all the voltage checks. Everything is either spot on or very close. On the U7 DDS chip though I have 4 suspect cold solder joints. I get voltage only when I hold the pin-probe with a little force. When I started, I did a quick check on pin 1 on U7 and didn't get anything. I then check other pins on the same chip with zero. That's when I backed up and started down the whole list from page 23 of the ATS3a manual. U7 was the last chip on the page only this time I was getting volts. Just those 4 suspect spots. Ran out of time and had to go to work! At least I know the big stuff isn't fried. Can't wait to get back home from this graveyard shift and heat up those four pins. Now I had the headphones on the whole time and didn't really hear anything while doing checks on U7. I did hear a bit of static on a couple of pins on U1 & 2.

125. New poll for AT_Sprint

I completed the 20m module last night and performed a smoke test. I only had two issues that were solved in short time, but it begs a question of those in the know. I had two components that were cracked (I discovered this while reheating connections). I know I may have stressed the board installing the power connector, but it doesn't seem likely that would have cracked these components (two caps on opposite ends of the board). Could I be overheating the components? I usually run my soldering station at slightly under 700 degrees. Any ideas?? Has anyone else seen cracked caps?? They could merely be separating at the solder ends, too.

Tonight I should be able to finish the remaining modules now that I have a working main board.

Early on I noticed that some of the caps or resistors
would loose plating on one side. I would just flip
them over and use the other side. Maybe this is what
happened to yours? I have not had this happen in a few
kits so I think it might be heat related. Never had
one actually crack though.

Thanks Mike,

Perhaps crack is the wrong word. It may actually be separation at the plating or what looks like the end cap separating. The displayed symptoms are intermittents where pressure at various points on the board results in improvement or worsening of the condition.

At any rate, I had extra parts from N4RE's mods, so was able to fix the issues rapidly. C23 was one culprit - no/low sidetone and the C6 pyramid mod where the 220pf cap separated. I bought two mod kits from him thinking I would get two ATS-3 rigs, but then the ATS-3a came out.

Once completed, I will most likely dig into the assembly code and reverse the order of the switches since I like the original order on my ATS Mk I (recall I mounted the larger red pushbuttons on the top of the board).

Hey John and the gang;

Well I try to run my irons between 700 and 750 degrees with most tips. There is a thermal mass to be overcome when soldering, and this temperature range helps to limit the heat the components are subject to.

Running your iron at a lower temperature than the range I use WILL heat stress the components more as you will have to apply heat for a longer time.

You might have also mechanically stressed the components while heating them.

OR....they are/were just bad components. I try to test my components, especially components that contain "liquids" (and such). I use a E.S.R. tester for the electrolytic devices to see if the chemicals are breaking down or are dried out.

Anyways, I hope this small amount of information helps you out some.

Make sense to me.

Btw, the nr4e mods applied the ats3a will probably
only involve the last audio amp stage. Steve changed
the IF filter caps in the middle of the ATS3 runs, the
filter is now terminted, and it looks like he has
changed the 1st stage audio amp immediatly after the
IF crystals as well (f0 looks to be 1023Hz). The only
thing in the nr4e mod that is not done is changing the
last audio amp from bandpass to lowpass and you may or
may not want to do this. I have built mine stock for
now but may change it later so that I can change the
BFO/sidetone to something other than 600Hz (like 400Hz
or 500Hz). I am experimenting with lower sidetone's on
another ATS3 now.

Changing the buttons is easy. They are #define'd early
in the code so all you have to do is change some
#define's and you should be good to go. This should
work for both Steve's and my firmware....

133. Changing ATS-3 (and ATS2 and ATS3A) sidetones

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-11 18:57:07 UTC
From: Michael Harnage
Topic: 114 Message: 133

Hi Jim et al,

Changing the sidetone on these rigs is a little complicated. Many things had to be changed in the firmware to allow this. Starting with version M36 and for all subsequent versions you can change the sidetone for your ATS rig. This is set when the rig is programmed and is thus (not yet anyways) programmable on the fly. Here is a snippet of the code to show you what sidetones you can choose:

```
;
; Change the SIDETONE_DELAY will affect the sidetone
;
; 27 -> 606Hz default
; 28 -> 585Hz Steve's original choice
; 33 -> 496Hz close enuf to 500Hz
; 37 -> 442Hz for the musician's
; 41 -> 400Hz lowest we dare go
;
; DONT ALTER THIS YET -- OTHER PLACES IN CODE WILL
HAVE TO CHANGE TOO
#define SIDETONE_DELAY 27
```

As you can see it is setup for 606Hz by default but if you change the SIDETONE_DELAY to one of the other numbers you can get other sidetones.

The formula is basically 32768/SIDETONE_DELAY/2. So any value between 27 and 41 could be used. I just picked what I thought would be tones of interest.

Notes:

1. The LO is fixed in version M36. If you choose 400Hz, this means that during CO calibration you will have to add 41 clicks to whatever your calibration clicks were for 606Hz. Hope this makes sense. At some point in the future I will probably make the default LO vary depening on the SIDETONE_DELAY.

2. DO NOT CHANGE YOUR SIDETONE DELAY FROM 27 (OR POSSIBLY 28) UNLESS YOU HAVE DONE THE NR4E IF FILTER MODIFICATIONS. The resaon for this is that the stock audio filter has a bandpass filter set for 600Hz and if you set you sidetone to 400Hz it will just not work properly. The NR4E mod changes the bandpass filter

(last op amp in the audio chain) form bandpass to low
pass and this is necessary for changing the sidetone.

3. This works with my version of the firmware ONLY.

All the voltages are ok. I've rewound and tinned and installed L3 I've touched and jiggled about everything. Even took the shotgun approach and re-touched everything with the iron. Hmmmm Still no audio or watts out. Still get audio from the menu though. I don't know if it means anything, but I do get some weak static white noise (like an empty band) when I touch a tiny screwdriver on R1. But I don't hear any signals out there. Maybe time to ask Steve?

Roland,

Does it exhibit this behaviour with all filter boards?

Mike, The answer to your question is: Yes

Just got off graveyard shift. After I get some rest I might have an hour or so I can spend on the rig. I might try that cap to antenna trick. Did I mention I hear something that sounds like static when I touch my micro screw driver to R1? Of course any path it goes to also exhibits this malady.
I guess the next thing is to try is checking all connections from the DDS and the MCU. There are only a limited amount of parts here so I feel I'll get it sooner or later. I appreciate all the Help!

If you get static from R1 all the way back to the
antenna you are likely correct in thinking that the
dds/mpu section has the bug. Let us know what you find
there.

143. ATS-3A calibration

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-12 20:10:04 UTC
From: mertzdave
Topic: 143 Message: 143

Let me know if you think this calibration method is valid. It requires only the audio spectrum display on a PC (I'm using HamScope):

1. Install the 20M band module and attach an antenna to the ATS-3A.

2. Initiate calibtaion by holding the Split and Up buttons at power up until "CF" is sounded. Press the Menu button to skip the reference-oscillator calibration for now. "CO" is sounded.

3. Perform the LO frequency trim, noting the net adjustment from default ("up" presses minus "down" presses) so you can restore this setting easily and precisely. Measure and record the frequency of the audio peak. Press the menu to store this LO offset. "20M" is sounded.

4. Immediately press and hold the Menu button until "E" is sounded and then release to enter Direct-Frequency-Entry mode. Use the keyer paddles to enter "9999", setting the frequency to 14.999900 MHz (a bug in the band limit checking permits this). Press the Up button twice to move to an indicated 15.000000 MHz. You should hear WWV.

5. Measure the audio frequency of WWV's carrier beat note. Subtract from this the audio frequency recorded in step 3. This is the reference oscillator's calibration error.

6. Remove power form the ATS-3A

7. Again initiate calibtaion by holding the Split and Up buttons at power up.

8. Divide the reference-oscillator's error by 3. This is the number of button presses needed to adjust the reference. If the audio frequency of WWV was above that of the LO, press the Down button otherwise press the Up button this many times.

9. Press the Menu button to move to LO trim. Restore the previously-determined LO trim value by using the Up or Down button. Do not change the setting of the BFO trimmer cap. If needed, Use the Up or Down buttons to adjust the tone to the same audio frequency as before (or as close as possible).

10. Press the Menu button to save the calibration. Again tune in WWV (don't forget the two Up-button presses to tune up from 14.999900 to 15.000000 MHz) and check the audio frequency again. It should now be the same as the LO trim-check tone. If not, try

again with a slightly different reference calibration adjustment.

Note: The calibration reverts to default at the beginning of each calibration sequence.

My adjustments were 5 Down for the reference adjustment and 3 Up for the LO trim.

I'm not sure why the divide by 3 in the calculation. I thought it would have been a divide by 2, but that adjusted too far for me. Also, I thought the LO trim calibration should change with a change to the reference calibration, but I did not really notice any (would have only been a 5 Hz change anyway, I think, so I just might not have noticed). The main idea is to get the beat note of WWV to be the same audio frequency as that of the LO calibration tone.

Anyway, let me know if I went wrong somewhere.

Have a look here, it may be easier.

<http://w1mt.qrpradio.com/ats3calibration.html>

Method in the link does not require a filter module.

More comments inline below.

50MHz divided by 15MHz = 3.333 (more accurate)

I use 10MHz WWV as a check. With the 30M filter and my
firmware I can DFE right to 10.000000MHz and hear the
carrier right on my sidetone pitch. Also, can see it
on the screen with the right audio spectrum software.

CF affects only the 50MHz dds oscillator calculations.
CO changes the BFO freq used to determine the receive
offset. One does not affect the other.

> Method in the link does not require a filter module.

But it does require a separate receiver, which I do not have, so I wanted to work up something else that only required matching the tones.

> 50MHz divided by 15MHz = 3.333 (more accurate)

The step size of the adjustment to the reference is 10 (0.00002%). The LO frequency when tuned to 15 MHz is about 10 MHz, so a 0.00002% change in the reference value should produce a change in the LO frequency of about 2 Hz. I guess I still don't understand why what I think is a 2 Hz change in LO frequency doesn't seem to move WWV's beat note by 2 Hz also. Remember, about 5 Mhz of the total of 15 is controlled by the crystal connected to the BFO trim cap and will be unaffected by a change in the reference value. I don't think 50/15 applies. But then I still have a mystery (to me).

> I use 10MHz WWV as a check. With the 30M filter and my
> firmware I can DFE right to 10.000000MHz

Ah, true, the original code has no lower limit check, so I can do the same. Just beware that the original code does not zero the 10s digit of the frequency, so don't use the Up or Down buttons before DFEing straight to 10.000000 MHz.

I'll have to compare and see that the beat note from WWV on received on 15 MHz is the same as that received on 10 MHz. It better be, otherwise I'll need to re-think this. Using WWV on 10 MHz should require a different amount (twice the amount, I think) of adjustment for each 1 Hz difference in audio tone.

> CF affects only the 50MHz dds oscillator calculations.
> CO changes the BFO freq used to determine the receive
> offset. One does not affect the other.

You are right. I was thinking like I was adjusting the oscillator, not just the number used to calculate the DDS frequency register value (and is not used to adjust the value put in the DDS frequency register for the LO trim adjustment procedure). Duh.

So I think my procedure is still valid since I think it's essentially comparing the beat note of a signal from a precise 15 MHz reference with that of a "signal" on exactly 0 MHz.

And it is.

This implies another method for determining the reference error that is completely independent of the LO trim and can be checked without disturbing the existing calibration. It effectively compares WWV 15 MHz minus WWV 10 MHz (which is precisely 5 MHz) to the LO tuned to receive 15 MHz minus LO tuned to receive 10 MHz (which is 5 MHz plus error).

Topic: 143 Message: 148

It does apply. Remember that only the tx freq is calculated with the CF constant. The rx freq is calculated with a simple subtraction (or addition in the case of 80M) from the tx freq.

Here is an example, suppose it takes 1 click to set the freq calibration (that is 10Hz at 50MHz). If you set the rig to 15MHz you have just gone from an error of 10Hz at 50MHz to 3Hz at 15MHz or a 10/3 (3.333) divide factor. [xHz/15MHz = 10Hz/50MHz, solve for xHz]The rx freq is then a simple +/- from that so the error is constant at 3Hz, in this example.

Hope this makes sense.

[sri the links I posted earlier aren't coming thru properly, hope everyone can cut and paste appropriately]

Well, let's see right ratio wrong application, dooh.

Dog wakes us up at 4am this morning and I can't get back to sleep and my mind wondering and I end up rethinking the clicks/calibration issue.

In the example I gave, it should have jumped right out at me but it didn't. If you divide your offset at 15MHz by 3 you do indeed get the number of clicks that it will take to correct during CF. Reason is that for every 10Hz change (click) one makes at 50MHz there is a 3Hz change at 15MHz. My analysis should have had us multiply the offset at 15MHz by 3.3333 (instead of divide) and then divide by 10(Hz/click). Which is the same as divide by 3. Dave's empirical observation was right on!

This stuff really keeps me on my toes.

So, here are the question of the day:

If there is a 70Hz offset at 10MHz how many clicks will it take to correct during CF, in an ATS3A? [Hint: Divide by 3 won't work, it is 10MHz where we are measuring]

Extra credit, if it was an ATS3, how many clicks?

Yeah, I finally worked this out myself just before reading your two latest posts.

My problem was that I wasn't paying attention to the way the frequency register value was actually calculated. I was thinking in terms of calculating it from the LO frequency instead of the Rx frequency and then subtracting the IF offset.

> If there is a 70Hz offset at 10MHz how many clicks
> will it take to correct during CF, in an ATS3A? [Hint:
> Divide by 3 won't work, it is 10MHz where we are

If either procedure is done by comparing to the 10 MHz WWV signal, the number of button presses would be the offset divided by 2, so 35 clicks.

> Extra credit, if it was an ATS3, how many clicks?

The ATS-3 also changes 10 Hz per click but at 40 MHz.

70 * 40 / 10 / 10 = 28 clicks.

Actually, I was quite impressed that my 50 MHz oscillator was only off by 150 Hz (3 ppm).

Dave

The receiver can be checked without a band filter module by just plugging a wire into the Rx-In (J1-1 as indicated on the Tx page of the schematic, not the incorrectly indicated J1-4 on the Rx page). The receiver defaults to 20 meters in the absence of a filter module and you can DFE to WWV on 15 MHz by entering 9999 and stepping up from there.

Roland, I'm not sure if you said or not: Do you get 10 MHz on TP1 (or better yet, on DDS pin 19, accessable at the end of C35 just above TP1) when in CF calibration? This requires nothing working but the processor (we know it is), 3.3V (we know it is), 5V (we know it is), the 50 MHz oscillator (we don't know), the DDS chip (we don't know) and the DDS output not shorted. Of course, this is almost all of the same stuff needed for transmit (add the PA circuit), so I really think your problem is in the area of the DDS chip. It's also the finest-pitch part, so most likely to have a soldering error.

However, a problem with no 10 MHz could also be with caused by no signal from the oscillator. See if you have 50 MHz coming out of it on pin 5 (the pin next to "OSC").

Dave is correct with a two correct answers. :)

I have worked this out numerous times, just can never remember it when I need it. Now at least, it is captured in this group and I know where to go to "remember" next time.

Yes, this batch of 50MHz oscillators seems to be quite well calibrated. Mine was very close too, abt 20Hz off at 10MHz. I have seen some of the 40MHz oscillators be as much as 100Hz off at 10MHz. (Still quite good as that is 10ppm and the parts were spec'd at 20ppm, if I remember correctly).

From: Bruce Beford
Topic: 155 Message: 155

Hi Gang.

I finally found some time this week to put my ATS-3A together. I built the original ATS-3 when they first came out, so I knew what to expect.

The building of the main board went fine. No problems found. Total time was about 5 hours. For those waiting to start, I will just say read the directions. Steve often puts hints in the text on what to watch for at various points.

One difference from the original ATS-3 is the mounting of the toriod choke for the final transistors. In the original ATS-3, it was mounted 'laying down' on the bottom, or button side of the board. In the '3A, it is mounted vertically, on the same side of the board as most of the components.

In the 3a, Steve has also instructed the builder to mount the output transistors laying flat against the board. This allows the board to act as a heat sink, and help dissipate the heat from the transistors. Steve used this same trick in his Universal QRP Transmitters he also sells. In order to get the transistors to lay flat against the board, it is VERY important to follow the instructions on page 17 concerning the mounting of D3. This is a glass, thru-hole zener that is mounted on the back of the board. Steve cautions the builder to be sure to cut the leads for this diode "as flush to the top side as possible". I would suggest fitting the diode into it's holes, then removing the diode and trimming the leads before soldering. This way, you can get the lead length down so they go into the holes, but don't extend out the top side of the board.

One other place you need to be mindful of is the mounting of the mounting of U12 of the 'back' of the board. This part must be mounted such that it is rotated from it's expected position. A well-placed and illustrated note on page 16 of the manual show this quite well.

So far, I have only completed one band module, for 20M. The radio checks out fine, and has good sensitivity on this band. I will be proceeding to the other modules next.

I have posted a high-res picture in the Files area of the top of the main board, and the 20M module, for those who may find it a useful reference.

72/73,
Bruce N1RX

The -3A instructions do seem indicate that L3 is a top-side
component, but it fits just fine on the bottom as in the -3, so
that's where I put it. It seems better protected on the bottom. I
used a bit of Kapton tape as extra insulation between the coil and
the tin and between the coil and the board. (Kapton tape... really
good stuff, but expensive, close to $0.03 an inch for the 3/4"-wide
stuff.)

Looking closely at the pictures of the board in the manual, it seems
L3 might have been installed on top of the board for the bottom-side
picture but removed entirely for the top-side picture.

Dave

157. L3 mounting for ATS-3a

Steve mentions in the captions of the pictures that they were taken with the thru hole components not mounted (or in the case of L3, I suspect, it was removed). This was due to the fact that he just plopped the board down on his scanner for the pics. The thru-hole components would have raised the board too far off the scanner for a clear picture.

L3 should work perfectly fine either above or below the board. Builder's preference for this part, I think. The kapton tape (or similar insulator) is a good idea if mounting it below.

158. Elmer 101 program for ATS3a

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-14 00:32:54 UTC
From: nn4cw
Topic: 158 Message: 158

It seems that the ATS3 would lend itself to an "Elmer 101" type program that was done with Dave Benson's SW+ series of monobanders. http://www.qsl.net/kf4trd/faq.html The project combined building in stages with discussion of the electronics.
I'd like to try building an ATS3a in stages, testing as I went. I've successfully built three ATS's, but I think the "Elmer 101" type build in stages would go a long way in educating me fully as to what was going on electronically. It would also help those who after the last solder joint, don't hear a peep. I don't think I could have built my K2 any other way but in stages, tesing as I went, but it didn't help me fully understand what was going on.

Gil NN4CW

I think the building blocks would be power supply, processor and audio, DDS, the remainder of the receiver (mixers, IF fliter and AGC), the remainder of the transmitter, and the filter modules, in pretty much that order (maybe one filter module before finishing the tx). Each subsequent block depends on most or all of the preceding ones.

The practical consideration I see against this is that getting the processor running requires mounting bulky (relatively speaking) parts on the bottom of the board, making assembly of the subsequent blocks more difficult unless a fixture is used to support the board (perhaps the mounting hardware that comes with the kit can be used as legs).

Certainly I've used this project to get a much better understanding of receiver operation, but mainly by understanding how and why the code for the processor controls everything the way it does (I'm mainly a digital-hardware guy).

First thing I do when starting one of these kits is to
put the bolts, spacer and nut on the board exactly as
suggested below, so that I can work on either side.
This way you don't lose the mounting hardware during
the process. :)

165. ATS-3A assembling by BGA infra-red placer ERSA

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-14 16:44:46 UTC
From: Petr Ourednik
Topic: 165 Message: 165

Hi folks,

are You interested in the assembling the ATS-3A by professional system like BGA infra-red ERSA P550A system?

If yes then check the Photos/ATS-3A by OK1RP where I placed some pictures from first part of assembling with this system.

You can see over there step by step the assembling procedure from blank PCB to fully assembled ATS-3A inspected by infra camera > maybe ready to install by NASA to space-shuttle ? :)

BTW: The components assembling before the heating by infra pics missing now > will be added asap.

Depending to my high quality assembling technology we will see if it will work like a champ ;)

Best regards,

Petr, OK1RP

Please don't take this as critism...it really is not. But I have never understood the necessity of these Rube Goldberg machines for working with SMT parts. (Unless you have majorly shakey hands...then I could see it.) I also hear many stories about the danger of using fine tipped tweezers.

I think the problem is that people get cheap tweezers that don't offer good control of the part.

I have a fine tip tweezer (an ESD one) that cost about $20. Expensive, yes, but I have never ever had a part spit out of it.

As far as holding the part down. Tin one pad, then heat it and place the part on it first...it is truly held after that on its own...no contraption required.

After getting over the fear factor of working with something different, I now prefer working with SMT parts. They are much quicker to work with...and I think they make nicer looking boards...like a little sci-fi city scapes.

Regards,

Dave (and others), I get exactly 10Mhz from C35 and 50.000Mhz from pin 5 in CF mode.
Kinda think I may have a short somewhere though. I soldered a needle to either end of a wire and carefully held it against each leg of the DDS and where the trace went to just to make sure each path was going where it was suppose to. I also did this with the MCU and a several other places. No difference. What I'm hearing at R1 sounds like broadcast type stuff. On Pin1 band module hole with the antenna/cap probe mentioned elsewhere, I get more frequency related signals but they are weak and I have to press hard with the pin. I get the same from some nearby cap but nowhere else. I'm wondering if I should attempt removing the DDS. That idea scares the heck out of me. But I'm running out of ideas.
hmmmmmm

Thanks everybody for the help thus far!

> I get exactly 10Mhz from C35 and 50.000Mhz from pin
> 5 in CF mode.

That's a good sign that the DDS is functioning okay. Check for
10 MHz at TP1. If it's not there, you'll want to trace it through
the filter that produces "DDS LO" (C35 to C37). DDS LO is then fed
back into the DDS chip on pin 17 where the DDS chip squares it up
and spits it back out on pin 16 to feed the TX at TP1.

If 10 MHz is present at TP1, move on to the "CO" LO offset
calibration. This requires that DDS LO is passed through the first
mixer, the crystal filter, the second mixer, the first audio amp,
the AGC chip, then the audio output amp (this is known to work).

If you get a good tone during the CO check, that leaves stuff between
the filter module and the first mixer as the problem area.

> I'm wondering if I should attempt removing the DDS.

No, I think it fine unless it's shorted at pin 16 or 17, killing
the 10 MHz signal at DDS LO or TP1.

> Hi Harry and John, I have had my ats-3 a long time, and it's in an altoids tin with the special computer software. For QRP outdoors I have an Elecraft T1 auto tuner that I recommend to you all. This tuner is just perfect for the ats-3 power. There is one problem I will talk to. The T1 while tuning presents a "bad impedance" to the ats-3 final amps and they draw a lot of current and the radio resets. The simple way to correct this is to use a 9 volt battery and this works fine. Another fix is a 10 ohm resistor in the antenna line you remove after tuning. The T1 holds the tuning once your happy.
>
The antenna I use is a 88 foot radiator end fed to the T1. Then two
counterpoise wires 30 and 35 feet long are connected to the ground of
the T1. I can load this wire on everything from 160 to 6 meters :-)

It really works good on 80, 40, 30 and 20 meters.

179. ATS-3A 40/30 Rx input filter mod

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-16 16:51:08 UTC
From: Steven Weber
Topic: 179 Message: 179

Hello everyone.

I hooked up my -3A rig the the ALT tuner and 40M end feed wire recently and was dismayed to hear SWBC heterodynes. The new front end was suppost to eliminate that problem. So much for theory!

Anyway, if you have this problem (it sort of depends on the type of antenna, tuner and your location in the world) there is a simple solution.

Remove the 2.2 pfd coupling cap between the Rx input coils. There is enough stray coupling that removing the cap only degrades the sensitivity a little, from about 0.2 uv to 0.5 uv, and seems to be enough to get rid of the heterodynes, at least here in NH. If this isn't enough to completely eliminate the problem, try changing the link coupling to the first coil from 5 turns to 1 turn. You will, of course, have to re-peak the coils and the tuning is now quite sharp.

Hi Karl and all user of the wounderful ATS3!

I am using the LED-SWR Indicator similar to that described from Steven, it puts a resistive bridge during the tuningtime of the ATU behind the PA and so the PA sees a value "near" 50 ohm.

The ATU cuircuit I am using is described on my homepage too. L/C switching is done by the dip switches. The ATU is fine with halfwave endfeed antennas.

The Electrocraft T1 is a automatic tuner so the SWR bridge is in the
tuner and the design does present low impedance to the radio while
tuning. I tune up sending dashes from the ats-3 and it takes around 10
seconds to reach a match.

My antenna is not always 1/2 wavelength. So I must match a wider range.

John,

oh, yes unfortunately You are right...I scorched a bit the PCB in the U6 area cause of my unexperienced operation with infra-red tool. I am not the operator of that tool. To be sure that Your parts will be soldered properly You need to peak up to 200C in the temperature profile. Main problem is timing for each of the temp period > 30 - 70 - 120 - 170 - 200C frames must be precisiously defined.
Second also important think is to adjust the infra-red beam at the good area on the PCB. If You have narrow beam then Your outer parts will not be soldered. That was my problem for caps C50/51/52 so I decided to heat this area a bit longer...wrong idea.
Furtunately the PCB is not damaged just coloured to brown a bit and will be coverd by uP U6 :)

More pictures comes soon.

Best regards,

Petr, OK1RP

Gil,

thanks for message. Yes I know that we have it in the company for long time but never used it as I am working with few SMD parts daily and its easy to soldering manualy...

When ATS-3A PCB arrived my friends had the idea to safe time and make it professionaly. I decided to try it as I have a chance to learn it and make good trainning on the BGA placer for the future.

Now I have all SMD parts mounted on the main PCB board.
Total assembling time was 3hrs including the arrangement and heating process.

I added the pictures where You can see the tools used for putting the parts on board, using the temp profile, heating the PCB incl. temp sensors watching the overheating.

Interesting pics are from inspection camera and also pics made thru microscope lens.

Enjoy it...:)

John,

oh, yes unfortunately You are right...I scorched a bit the PCB in the
U6 area cause of my unexperienced operation with infra-red tool. I am
not the operator of that tool.

Hi Petr, yes you did the usual error of a first time user. I assume you have an open heater that gets the board to around 100 C. I wait 20 minutes to get a good heat all over the board. Then you use a heat gun that will make 300 C and you keep it moving around and around and you watch as the contacts all sudden show solder instead of paste and around about 3 more times and quit.

This is all from Cash Olsen who lives here and has done this many times :-)

73 Karl

Hi,

just few mins ago I finished the posting the pics to Photos from assembling process of the main board of ATS-3S on BGA infra-red placer ERSA step by step.

You can find all pics from blank PCB to fully assmbled on BGA placer including the pics from inspection camera and even pics thru the microscope lens.

Now is inspected asd ready for next step of building the ATS-3A baby.

Enjoy it :)

191. Batman tins backpacking setup complete

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-19 00:05:41 UTC
From: n0hj
Topic: 191 Message: 191

I just posted top and bottom view photos of my backpacking rig setup. Lots of extra room inside - it will hold my Koss earphones, my KK5PY TE NE Key, pencil, and small pad of paper for logging. Total weight of this setup without end fed longwire is 16.4 oz as shown.

The large board for the tuner is overkill, but I wanted to see if I could make the setup as general as possible, in case I want to be able to swap tuners as needed. The tuner works fairly nicely on 80/40/30/20m with low SWR on 40/30/20 and 1:2.5 on 80m - maybe if I tweak the length of my end fed, it will behave better.

This setup will be christened on an upcoming Colorado Trail trip with N0TU !!!

Topic: 175 Message: 193

Greetings all,

I just posted pix of my completed (for now) Batman tin backpacking setup with ATS-3, Fuchs tuner, 8 AA lithium battery pack, with room for band modules, Koss earphones, KK5PY Te Ne Key, and pencil. I will also include a small pad of paper for logging. The total weight is 16.4 oz with all accessories protected inside. There are no switch or control protrusions to get mangled in my backpack (hey, I'm a gorilla sometimes) and the rig is pretty much grab and go.

I keep my 41m end fed wire wrapped around a titanium clipboard that also doubles as frame support for my backpack.

The Fuchs tuner worked pretty well today on a 41m (134.5 foot) wire I thru in the trees in my yard in an inverted V configuration, fed at one end. I can get low SWR on 40/30/20m (typically 1:1.6 or less) and can still get 1:2.5 on 80m. I suspect if I shorten my wire a bit it may get closer to 1:1 for 80m. There are hardly any parts in this tuner, compared to my ZM-2 which weighs a ton (relatively). I used header pins for the two rotary switches in the Fuchs design which make for a smaller and lighter design. I had thought about DIP switches, but I was not comfortable with durability after repeated usage. Of course, the little header jumpers can get lost, so I am working on a fix for that possibility.

194. Keyer memory usage

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-20 15:53:25 UTC
From: w1mt
Topic: 194 Message: 194

How many of you guys use the keyer memory? How many characters do you use?

Trying to find out if a reduction from 124 bytes to around 70 bytes would be an inconvenience to anyone. If I can drop the keyer memory total bytes to around 70 I can free up a ton of program space. Enough to add some more functionality to the firmware. Right now I have almost 600 bytes free just begging for something else to be added to the firmware.
:)

Date: 2006-07-20 16:10:41 UTC
From: Jeffrey Embry
Topic: 194 Message: 195

Mike and all,

Once I get the thing together I plan on using the memory keyer primarily for sprints to call CQ and possibly my exchange in the 2nd memorey space. I could do with one memory for CQ only, if that would help. So ti wold be CQ SP K3OQ TEST....so it looks like 15 characters including spaces...and if the exchange is in there it would mbe 559 MD 3W...or 9 characters including spaces. I will also be changing the SP to FP for the monthly Flying Pigs Run For the Bacon.

Status of my ATS3a. All that is left on the main board is L3 and then the filters. Gawd I hate winding toroids...so I am procrastinating. But it will be ready for the next Spartan Sprint.

Let me know if this is of any use.

72,

Jeff - K3OQ-

Mike, it sounds like you've been busy.

I would add a 2 characters to the CQ for my longer call. I would also use the third memory for just my 6-character call. For contests other than the Spartan Sprint, I would probably do keying from my PC instead.

(... and I am now using Mike's code, slightly modified for my non-standard paddle wiring.)

If you want a suggestion for filling up that available memory, I've been looking at doing RTTY. One paddle input would be used for PTT and the other would be for TXD. PTT would key the transmitter and TXD would control the frequency-register selection to switch between two frequencies separated by 170 Hz (no hardware mods needed to the ATS-3A).

It might also be possible to do BPSK using the DDS's phase registers.

Dave

Topic: 199 Message: 199

I finally got 'er going last night and at about 3 am I answered a CQ from a VE7ALQ. I was on 40 meters. About a 1000 miles. He was in Vancouver, B.C. We chatted for 15 minutes and he QSB'ed. I am very excited about this rig and can hardly wait to start my swing shift and do my clandestine ops. (playing while I'm on the job). Although it's been 114 degrees the past two days so I may just stay next to the computers indoors as much as possible. But there's always graveyard shift in a week. hi hi

I wish I had done a better job during construction but oh well. The next rig for sure. I had some soldering issues. Lot's of cold solder joints. The reference oscilator was not soldered well other spots. Thanks Steve for the rescue! And to all the other members here too for all the advice.

Now I can plan some camping trips and really have some fun! So, what are you guys doing out there with your rigs? I'm sure we'd all like to hear about it.

Excellent! I was wondering how the troubleshooting was
going. Great job.

I currently have 2 ATS rigs in the stable. A modified
-3 in ultra skinny mode for Spartan Sprints. This one
runs at a lower sidetone lightened to the max (or
close to it). I just repackaged it into a lighter
container, changed the ear budd and shortened the
power pigtail. Under 2 ounces for 3 bands. Btw, my
bareboard+ear bud+battery+1 filter board weight is
0.100 pounds or 1.6 ounces. That's gotta be the the
limit for weight with this rig.

My other ATS is a 3A that is currently living in a
painted Altoids box (olive primer). Have a Hammond box
that is big enough for an Elecraft T1 and the -3A --
still thinking about how to hold the boards internally
and whether I want to cobble together a 4 band filter
board that will take commands from the main board to
control which filter is switched in. Also, not sure I
am ready to cannablize my T1 for this
project.....might have to get another T1.

I was wondering which is the best headphones for the ATS. I know it's a bit subjective, but I'd like to find what is best vs. cost. So far I've found that my XYL's i-pod's ear buds to be the best. But I'm not a fan of ear buds. I'd rather have somthing over my ear. Yet the i-pod ear buds sound better than my $40(on sale) kingston head phones. What are you guys using?
Roland
PS 2nd contact on 20 was in Hawaii, not much by DX standards from California, but I was very happy. The band wasn't even that good then. 3rd qso was about 200 miles away in Reno. That was a good 23 minute early afternoon qso on 40. The other fellow was using the famous kx1.

Well, it sure is subjective. For the money, I think
the Koss "The Plug" are the best. For over the ear
Koss makes the Radio Shack Pro 35 (33-1222 being
discontinued at $20-- decent price). I notice that R/S
is going to sell the Koss version (33-1248 or
something like that) at double that price. Get the
33-1222 while you can. For ear buds, I happen to like
Sennheiser 550's (Circuit City, I think). They were
about $25 and sounds real nice.

If you want to spend more money, in the ear is the way
to go. Lots of makers (Shure, Ultimate Ears, etc).
These will cost any where from $100 and up. I don't
have a set yet but some on the list do and they work
quite well from what I have been told.

There is always the old standby Sony completely over
the ear headphones (MDR_7506) at about $80-$99 street
price. These are very nice and comfortable.

USPS just brought me a nice lil surprise here at work. It's my first ATS rig, an ATS3 I purchased late last week from W1RT.

Here she be:
http://img106.imageshack.us/img106/303/ats3jp5.jpg

I had John flash it with Mike's latest firmware before he shipped it.

I will probably begin repackaging it shortly in a slightly larger ABS enclosure with an internal 2200 mAH LiPoly pack to make it my weekend backpacking rig. I will probably order an ATS-3a in the near future for an ultra-lightweight Spartan Sprint build. Steve is almost sold out on the current batch so it won't be until the next batch most likely.

For now, I will try and get on the air this evening with her in her Wintergreen Altoids dress and a 9V battery. Thus far, the YL isn't too impressed judging by her "you paid $165.00 for that?" comment when I showed it to her. Oh well, she has her new found geocache obsession and I have my minimalist QRP CW obsession.

Hi Mike, the ones I use all the time I bought at Big Lots for $6.95.
They are COBY Digital Stereo headphones and all things considered they
are the best for all uses I have ever found. I bought 2 more pair and
have them held as spares.

I didn't feel too bad about saving weight by cutting one ear bud off of my $0.97 Wal-Mart special ear buds. And it doesn't sound too bad, particularly with the relatively narrow audio bandpass we are dealing with. I ended up buying a few more just to get the wire and plug.

When running the rig on the bench and not going for minimum weight, I use an old, powered PC speaker that has a volume control.

From: JT Croteau
Topic: 215 Message: 215

While rummaging around, I've come across a couple of these blue plastic boxes. Measuring 5-3/4" x 3-3/8" x 1-1/4" (LxWxH), they are a bit bigger than an Altoids but appear to weigh about the same because it's pretty thin plastic.

The hinges are formed plastic so I'm not sure how they will hold up in the long term.
However, it looks like there is enough room in here for my 2200 mAH LiPoly, filter board storage, and the ATS3. I can't start test fitting stuff together until the LIPO arrives from Hong Kong in a few days.

Here are a few pics -

Hi Steve. My YL and I own an aquarium maintenance business and retail store. These boxes came from scratch remover kits for acrylic tanks. I have no clue where they procured these boxes but they are a huge conglomerate and probably got them off shore in China or someplace.

I think I have two empty cases and one new kit sitting on the shelf.

217. Adjusting LF1 and LF2

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-27 14:01:54 UTC
From: Dave
Topic: 217 Message: 217

When running my ATS-3A on the 11.1V (more like 12V fully charged) Li-Po battery, I've noticed that it seems to put out about 5W on 80M and 30M while putting out only 3.5W on 40M and 3W on 20M (into a 50 ohm dummy load). A bit of testing showed that with the 40M module installed, I can get about 5W, but well above the ham bands, so I figured that adjusting LF1 and LF2 might help.

First I tried slightly changing the turns spacing. That didn't make any measurable difference. So then I tried adding turns to LF2 using leftover wire scraps. That seemed to help quite a bit. I ended up with two extra turns, raising the inductance of LF2 from 1.24 uH to 1.55 uH. To keep LF2/CF3 resonant at about 14 MHz (described in Steve's circuit description), I dropped the value of CF3 from 100 pF to 83 pF. Then, with my remaining wire scrap I added a turn to LF1, bringing it form 0.97 uH to 1.10 uh. At this point I'm getting about 5W on 40M.

Am I going about this the right way or am I just fooling myself somehow with the higher measured power readings? Am I just messing up the filter and letting more trash through or something? Peak power does seem to be showing up at about a 300 kHz lower frequency now. It seems that these changes move the cutoff frequency lower.

Perhaps I would be better off with only one additional turn on each toroid. What I'll probably try next is moving my 17-turn LF2 over to LF1 and and adding 2 turns to the original LF1 and moving it to LF2. (I'm trying not to cut my 1- and 2-turn wire scraps since it's all I have.) With LF2 at 1.39 uH, I think I'll want make CF3 about 93 pF.

Dave, WA3OFF

L2F and C3F form a tank circuit that ideally should
knock down the 1st harmonic of the chosen band. They
should be adjusted with that purpose in mind. If power
peaks at that point then all the better. I subtracted
a turn from L2F on 80m and added a turn on 20m keeping
the caps the same. YMMF.

Ed Wetherhold/W3NGN wrote this filter up in the Feb
1999 QST. <

Steve designed this rig to get 2.5 watts at 9v and
that is where I try to get my rigs. What ever they get
at 11.1v (I use lipos too) after that is fine with me.

I wasn't worried so much about where the power peak was (except to indicate which direction things needed to move) as I was about getting 40M to perform up to the level I was seeing on 80M and 30M. It was rather shy of 2.5W when running on 9V, suggesting that it could be improved.

> Ed Wetherhold/W3NGN wrote this filter up in the Feb
> 1999 QST. < http://www.arrl.org/tis/info/pdf/9902044.pdf >

Thanks, that's helpful. I need to study it some more to get a better handle on this stuff. I'm a bit fuzzy on return loss.

My values for CF3 may be a few percent high. I was using 14.0 instead of 14.3 for the resonant frequency.

My main concern is whether or not I was seeing higher output power at the expense of corrupting the design of the filter and preventing it from doing its job.

Dave, WA3OFF

I would use 14.0 too. Adjust the numbers in the
article accordingly.

I guess what I was trying to say was that I would go
for neutralizing the 1st harmonic primarily then
power.

Enjoy the rig!

Guys,

A little slow at getting this rig together. This evening finally got around to the power up test. So far so good. Got the 20M indicator but, was unable to do all the voltage checks. I need to get a clip for the 9 volt battery. Thought I had one...but evidently did not. I can say this....hearing the 20M in CW was pure music to my ears.

Tomorrow I get the clip and finish the testing. Then finish the Band modules. Then we will play.

Hi

IMHO the match of the LP filter to the PA -FETs has a good potential of further optimization. For my ATS-3 I got some mods from David Meacham W6EMD which brought 3.4W /9V on all bands with 4.5W on 80m. Won't be showing off too much , but its true. And that's not the end. I heard from Fred DJ3KK who built the ATS-3 PA,driver section on a piece of PCB to analyse and improve the match. He achieved 5W/9V on 40m finally. At the moment he is building his 3A but I will encourage him to publish his findings. I hope for him to optimize the other bands as well ;-)
The LPF mods from David W6EDM have not been published yet AFAIK so I am not authorized to do this. --very sorry. Please ask him. He is on the QRP-L.

Hey Lutz and the gang;

These mods are FB in my opinion. Anything to improve these fun little radios is fine by me.

I *also* hope that the someone will be publishing the harmonic results as well as the reported outputs.

i.e. Yesterday I loaned out my ATS-3A and it was analyzed at an RF lab. The results were fairly good and in some cases quite good as far as 2nd harmonic content was concerned. These measurements were done with the stock filters. (I think there was some issues with how the power tap was done as my P.O. readings I did two weeks ago differ, BUT the harmonic content should have remained the same regardless of that and the harmonic content readings were automatically given as dbc. i.e. decibels below carrier.)

(I dare not take the unit into my work and use the Spectrum Analyzer there, as I am on vacation, and they would give me things to fix if I showed up !!!)

Back to the point. Sometimes you can get greater output at the expense of, or because of, added harmonic content.

BTW if Steve gives me his blessing I will be happy to share the lab results. Until then the results will remain private. I really want him to *see them first* before I do release them publicly.

Hey Mike and the gang;

The 3 and 3A *ARE* different in the output filtering as I recall. John's web page measured a 3. The radio I just had at the RF lab is a 3A.

Changes in the output filtering circuits (probably) WILL change the results at least enough to be noted. In some cases these changes might be dramatic. But I will let the testing results speak for themselves as to how significant such differences may be.

So long as you don't stray too far from the original, you should be safe.

I picked 2.5 watts at 9 volts as a good compermise between reasonable power out, Tx current, effiecentcy and not having the power out get dangerously high when using 12 volts.

The output of the 3A is a bit cleaner than the 3's. The -3 was a bit marginal, because of blow by. On the 3A, I moved the ground pin to be between the in and the out of the filter and moved the parts around to get better isolation between the in and out.

When playing with the filter, its a good idea to monitor PA effiecentcy. You can put an amp meter in series with the supply and subtract out 40--50 ma (depends on band) to get the PA current, then measure the voltage going into L3. More power out can often result in much poorer effiecentcy. And of course, its really nice to have a spectrum analzer, so you can make sure your not degrading the filter.

On transmit the major change is that C1F is larger for each band. The basic harmonic trap is essentially the same (a turn or two change on the tank inductor for a couple of bands). The inductor before the antenna on the main board is also different. I would be very interested in seeing the results of testing on the 3A for comparisons sake. Any chance you might mod the filters for maximum harmonic dampening then run it thru the rf lab again?

This is good stuff, I enjoy hearing what others are doing with their rigs!

Steve, thanks for the suggestion on monitoring PA efficiency.
Certainly with the desire to minimize battery weight for the Spartan
Sprints, efficiency is important.

I'm deficient in spectrum analyzer equipment. I would enjoy actually
measuring the differences as I tweak the filters. Maybe I'll start
shopping for one.

I think this is a lot about nothing. I built a 3 early and followed
Steve's instructions. Then counted the turns on the toroid(s), took both
out on 80 meters and re-wound them. Then I got around 2.5 watts with 9
volts and it has worked just fine.

232. ATS Antenna Jack Wiring

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-30 20:07:53 UTC
From: JT Croteau
Topic: 232 Message: 232

This may be a silly question to some but I'm still a newbie to homebrewing and kit building and need to ask.

As I begin to repackage my ATS3 into an "all-in-one" package in a larger case with room for batteries, paddles, antenna, etc., I've just thought of something that I hadn't really given any thought to before.

This will be my backpacking/bed side rig, and to best accomodate operating comfort, all jacks will be on one end of the box. This means the antenna jack will be on the far opposite of the case from the solder point on the ATS3 circuit board. Ideally, one usually wants to keep the antenna wiring as short as possible but this config will require an 8" to 10" run from the board to the jack (BNC). Will I take a noticeable perfomance hit or experience stray RF problems with this long of a seperation distance? I have a small stash of low loss coax that is used with Motorola 800 MHz mobile antennas that I was planning on using. It's a tad smaller and more flexible than RG-174 and supposedly considerably less loss

Thanks

233. Need help trouble shooting ATS3A

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-07-31 19:57:33 UTC
From: Glenn Maclean
Topic: 233 Message: 233

I just finished putting together my ATS3A. The calibration of the 10 MHZ osciallator went fine. Centering the filters went well also. The voltages on all of the IC's are per the chart in the manual without the filter board installed. All of the menus work. RIT works, tuning up and down works, and storing messages in memory works.

Here is the issue I am having. I do not hear any floor noise when I connect the antenna. I do not hear any signals. If I put a metal screw driver at the rx in side of C1 the receiver comes alive. I can also put a screw driver on P1 of the filter board when it is installed and the receiver works. I have tried peaking the trimmer caps on the filter board and it does not seem to help. I have the same problem with the 20 and 40 meter filter boards. I have not built the 80 and 30 filter boards yet. I have triple checked the cap values and locations on the filter boards and they are correct, The toroid windings are correct as well as well as the proper cores in the proper locations.

Any help as to where my problem might be would be appreciated.

Thanks,
Glenn Maclean WA7SPY

Hi Glenn,

When the rx "comes alive" does that mean that you can hear signals where they are supposed to be? (Another tx or signal generator is heard where you expect?)

I would start with the 20m board (it is simpler) and try the non-grounded sides of C5F and CT3 with the screwdriver to see if you get reception. If those two caps are OK then you should get reception. Then I would try the left most hole for L3. This should be the non grounded primary end. If that fails and I am guessing that it will, you probably have a problem with the transformer (LF3). Triple check how it is wired to the board. The outside two holes are for the primary (large number of windings) and the inside two holes (smaller number of windings) are for the secondary.

If this fails come back with what you found and we try to proceed from there.

Hi Mike, excellant ideas and I bet Glenn gets it working. The rig is tuning up proper and my money is on LF3 being bad or, my trick, a pin not soldered.

Hey Glenn;

You got the right idea about how to troubleshoot this. Just keep looking for signal as you go further "downstream" toward the antenna. When the signal is no longer there you will have found the shunt (short to ground) or open path.

Often this is a bad connection of a wire lead associated with the coils. Sometimes the enamel or plastic coating is hard to fully remove and is preventing a good solder connection and thereby the signal flow.

Hi Mike,
Thank you for all of your suggestions. I played with the ATS3A tonight and tried your suggestions. I could find nothing wrong. I was getting noise with the screw driver touching all the points you suggested. I started playing with my antenna connection. I noticed if I disconnected the ground to my Pl259 connector that went to the BNC adapter I was able to hear floor noise and cw signals on both the 20 meter and 40 meter filter boards. I was also able to peak the noise on both the 20 and 40 meter filter boards by adjusting the trimmer caps. I think I may have a problem with my antenna which is a Carolina Windom from Radio Works which is many years old. I am going to have to look into this further.

I am getting 3 watts output with a dummy load and the power supply set to 11 volts. As far as I can tell the ATS3A is now working as advertised. Now it is on to packaging it up. I think I am going to bend up some metal and make my own case. I work on corporate jet airplanes for a living. I have plenty of access to sheet metal and sheet metal tools.

Thanks again for everyones suggestions.
Glenn WA7SPY

FB job. I would make sure it was the antenna by
checking it for continuity.

I spend way more time putting my ATS rigs in
enclosure's than I do building them. :) Have fun and
show us some pics when you get done.

Hi,

My favourite tool for such kind of trouble is a small wideband_noise generator probe. I use it to set up all stages from lf , if to the bandfilters. Every kit builder should have one It's so easy to build and really cheap. I guess there is even a source for kits over there in the US. At least here in EU are some.

Hi folks,

another part of job done on my ATS-3.

Unfortunately I have lot of breaks as I am really bussy now but the top side of main board with buttons and other parts is finished.

On bottom side of main board is finaly uP and few elyt.caps installed.

Now I have to install all connectors, caps, trimer and finaly the toroid and seems to be all job on main board finished.

I am starting to thinking about the housing as I would like to have pretty matched to operate outside the QTH > so probably it will have to be builded the Lipol battery and for sure any type of ATU.

Now also the big job of assembling the band modules coming > wow...;)

See new pics in Photos/OK1RP if You like it. Finaly there is no BGA placer anymore used...

My opinion is that since you are running coax from the output of the
board to the jack, you'll have on problems at all.

Yes, another ATS-3A took it's first breath the other day. I couldn't belive it, but when I plugged it in, it played right off. Hard to imagine I got all those little No-See-Um parts soldered in right the first time, and didn't solder all the processor leads together into one big mass of silver. These old eyes needed lots of help!

A question for the group: The T-R transition is pretty smooth in the key down (receive-to-transmit) changeover, but I get a pretty good click or thump in the transition back to receive (key up). Is this the norm, or do I need to go sniffing around for a problem? In addition, the audio doesn't sound as clean as I'd like. With a strong signal, it sounds like one of the stages is being over driven, and the audio takes on a distortion that sounds almost like it is being clipped or squared.

Any thought would be appreciated.

Thanks,

Cam N6GA

It sounds like you have a problem around the audio output chip. The
loud pop when you let up on the key is not normal. The distorted audio
is not normal. There is the AGC chip that should correct the distortion.

It's quite possible both symptoms are caused by the same wiring
error. Get your eye help and just look at all the things including the
audio chip. There is something wrong.

Depending on the extent, this might be somewhat normal. The keying circuit has an RC network to slow the rise and fall to about 5 ms (according to Steve's write-up). There are delays built into the code between TX off and mute off, but maybe they aren't quite long enough. You might check the rise and fall time in the codeThis may be long enough for the software to switch off the mute, allowing the receiver to hear a bit of the declineing output. You could use an o'scope on the power entering L3 (the tab of Q4) to see if the fall time is longer than it should be due to an incorrect value for C42, C43 or R14.

The AGC, which can take a moment to respond to strong signals, should be taking care of this. This isn't just an iddue with your earphones, is it?

Hey Dave and the gang;

Actually if you view your rig's ramp-up and ramp-down of the keying envelope, by watching your RF output on a (decent/good) scope, you can see the differences in timing vs. incoming dc voltage. You can also see how "stiff" the supply is (dc rail sag).

And yes there is a thump, which is noticeable during bench testing. Much if not almost all of it seems to be "masked" (covered up) by band noise when hooked to a "matched" antenna system. Well at least with the summer noise levels.

The only other comment is to state the obvious. Lengthen the "turn-around time" alloted in the software may degrade the qsk performance, such that it is currently.

Hi folks,

today I completed the main board incl. the programmer connector. When I finished the daily job in company I took the ATS-3A to lab for first smoke test on bench...

It's like music to the ear hearing the "20m" morse code from the earphones immediatelly after power up for fisrt time :)

All steps from the Part I. of bench tests in manual has been done w/o troubles.

Just only two notes :

- there is bad connection in power connector (seems like bad contact inside of grey box on the PCB > will need to replace)
- the voltage on Q4 drain comes to 4.9V max instead of full DC input (9V). Then decline to 0V when stopped the dashes from the paddle. (measured by Fluke 189 true RMS model) Could be the problem?

The pics from thelab I added to Photos of course.

I am going to work on band modules...

72, Petr OK1RP

Very good!

Put the drain of Q4 on a scope and see what you get.
If you are using a 9V battery (small rectangular type)
then replace with a more capable power source. 6 x
1.5v AA alkaline cells or 8 x 1.2v AA rechargable
cells will give a capable 9v supply. Those 9v
batteries are not capable of supplying the current
necessary for transmit and that may be what you are
"seeing".

I put a 10 AA battery pack (rechargeable) and my ATS-3 with Mike W1MT's software of last year in it has no loud pop on key up and it doesn't overload with big signals on 20 meters with a good beam.

I'm pretty sure something is wrong with Cam's rig. But some could be due to a bad battery too :-)

Totally eliminating thumps is pretty hard, but it should be barely noticable. Check the connections on the mute switch, there might be a bad or marginal one there. Also, cleaning off the flux can help. A very soft power supply can exagerate thumps, but it would have to be droping below 6 volts.

Is this the
>norm, or do I need to go sniffing around for a problem? In addition,

>squared.

Very strong signals are clipped by the back to back diodes on the first audio amp. These keep the AGC amp from overloading, distorting and taking a long time to recover. It makes the audio a little raspy, but the audio band pass filter smothes it out so its not as bad as it could be. The problem your having might be related to the thump too.

I haven't really had an problem with these and no othe reports, be sure the plug is firmly inserted all the way. It can be a little stiff the first few times.

I belive your seeing an avarage voltage if your sending dashes. Put it in straight key or tune mode and it should go to DC in less the protection diode drop, about 300 mv.

I checked my rig again and what I get on key-up is a *slight* click or chirp that is really only noticeable when keying into the (quiet) dummy load. When connected to the antenna, even mild QRN really does mask it pretty well. So if yours is pronounced, that could indicate a problem.

I thought maybe there was a difference based on how much power the rig was putting out, but I noticed no difference when I switched from my 12V Li-Po battery to a dead (5.7V during Tx, 7.something during Rx) 9V battery.

Regarding the distortion, make sure that C26 is the correct value (10uF). According to the chip's datasheet, lower values of this capacitor increase the distortion produced by the AGC chip. In fact, give all of the parts in the audio section a good looking over, particularly the resistors and capacitors.

Not much progress as I am still waiting for a few parts to come in.

I just mounted the 2200 mAH Li-Poly battery using "extreme" velcro and took the following inside pic:

http://img383.imageshack.us/img383/3671/batinstallyo8.jpg

I wanted to keep the onboard jacks in case I ever wanted to put the rig back in an Altoids so I remoted them by wiring up some stereo plugs to the stereo jacks on top of the case. I used your basic gold stereo plugs from Radio Shack but it looked too bulky and weird with the barrel connector on so I left them off and just heat shrinked the wiring.

Now waiting on JST connectors and RG-316 to arrive. Additionally, a #2 screw from Steve as one of them was stripped pretty bad by the PO when I went to remove the ATS from the Altoids case. Neither Homo Depot or Lowes have screws smaller than #4's, major bummer.

I also need to decide on a paddle. I've used the Bulldog mini paddle before and it felt fine but I am also considering Doug Hauff's Porta-Paddle. I just love that blue annodized finish. However, it is twice the cost of the Bulldog. Either one would mount nicely on the top of the case.

- JT

I'll have to say that troubleshooting this little rig is the most fun I've had since grabbing a handful of volts while working on my Heath SB-101!

Now having dated myself seriously, I have to admit that the world of SMD parts and microprocessors is a brave new one for me. But the principles are the same (well, some of them?). The audio distortion problem I perceived turns out to be a combination of factors. Very strong signals, lousy earbuds and a less-than-optimum alignment job by yours truly all lent their hands to the problem. I went back and re-aligned the passband and found I had set it much too low. Then I tried four different sets of headphones and realized some are far lousier than others.

After dragging my 800 pound scope out of the garage and dusting it off, I took a look at the audio waveform and decided that it does, indeed, distort with very big signals. As Steve pointed out, big sigs do get clipped by the diodes in the T-R circuit, but then they are cleaned up by the crystal filter. But a signal big enough to max out the AGC circuit, even one which is down toward the lower edge of the passband, can look and sound pretty ugly. Mea culpa on this one.

OBTW, long periods of confusion finally cleared up when I realized that the pinout of the AGC chip, U5 on the schematic on page 32 of the manual do not match the pinouts and voltages in the IC Voltage chart on page 23. I admit I didn't search the archives, this has probably been pointed out here before.

As for the click on key-up, I'm still trying to make sense of this. The pictures I see on the scope lead me to believe that everything is working as advertised. When the T-R line goes high at end of the last character sent, the RF envelope decays quickly to zero (about 5 ms), the sidetone drops off at the same time, then about 60 ms later the mute line goes back high, turning the receiver back on. It is at this time that a noticable click happens. The RF envelope is long gone, so I don't believe it's a problem of hearing some of the transmitted

signal before it's totally shut off.

I pulled out my digital camera and am now wasting time trying to take pictures of the scope display. If this melding of old and new tecnologies (solid state camera and hollow-state ancient Tek 7600 series scope) results in anything useful, I'll post the pix here.

Thanks to all those willing to lend a hand,

Cam N6GA

Woohoo ~ Got all my SMT parts are onboard! Only momentarily lost one resistor which popped out of it's case when I pulled back the tape. It hit me in the nose and bounced into dish of ICs. Good thing I heard it hit the IC dish with a faint "click" or it would have been a goner for sure! I was the only one home at the time and it was dead quiet!

Probably no joy for a while as a busy week is shaping up. But just the through-hole parts, toroids and a module before the electrons find their way around my ATS! Sweeeet!

It's an 11.1V 2200 mAH Lithium Polymer pack built using 3 cells. The red JST connector is the power connector and the white 4-pin connector is used for balanced charging. These packs are used mostly in R/C model airplanes and I'm using an ESky balanced battery charger that came with a Helicopter that one day crashed and burned like it was hit by a Katyusha rocket.

I found the battery on eBay for $31.00 delivered direct from Hong Kong and I see the same RC Shop is selling the battery charger for about $10 + $12 shipping to the US.

Thnxs much for the url info OM....

Unfortunately from that same ebay store I see that battery and others listed as 11.1v 10c 2200 mah including one that is smaller in all three dimensions.

What gives ? i.e. Shouldn't batteries with exactly the same ratings be (essentially) the same size ?

Sorry if this seems like a stupid question, but with other battery chemistries the size vs. capacity rule is basically very un-elastic <- so to speak.

Hey JT and the gang;

Well I sorta answered my own question.

As it turns out, some of the URLS from this seller are not technically correct. i.e. "They" cut and pasted some odd/incorrect info into some of their sales URL's.

So...no biggie, and it seems like they have some very good prices. The 11.1v - 8c - 1200mah battery is spec.'d to fit inside an altoids case, all for less than 10 bucks. <- This one interests me.

263. Click Pix

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-08-08 19:18:52 UTC
From: camqrp
Topic: 263 Message: 263

Gang -

Been chasing my T-R transition click and was able to make a couple of pictures of some pertinent scope traces. I've posted them in the photo album.

In the first photo, the top trace is the Mute line, the lower trace being the audio out. What you see is the sidetone for the duration of one dot, then you see the "click" at the moment the Mute line goes high. It's pretty bodacious here, being quite a bit louder than the sidetone, although for only a few cycles.

The second photo shows the same audio output in the top trace and the RF envelope in the bottom trace. The RF was sampled at the antenna output. You can clearly see that the RF is long gone by the time the audio turns back on. The scope was set for 20 ms/div, who knows how well it's calibrated, but it's ball park enough.

To date I've cleaned off the rosin, re-heated all of the solder joints in any circuit that seems remotely related to the problem, and checked voltages where possible..

The click is worse at higher operating voltage levels. After the initial checkout on a wimpy 9 volt battery, I switched to a 12 v gell cell and that's when I really noticed the click.

Interestingly, the problem is worst on 40 meters. The other bands aren't nearly as bad. De-tuning the receiver input filter also helps quite a bit. I can easily de-tune it slightly on 40 meters and not miss the gain because it breaks my ears drums as it is.

So by running it at a voltage lower than 12 and detuning the front end slightly, the click fades into the background noise. Voila, End of problem.

But as I'm writing this, I think, maybe I'll just pull out L3 and see how bad it is with no RF present...

Cheers,

Cam N6GA

Hi all,

I just put my ATS3A on the scope and I see the same thing that Cam is experiencing. Also, put my ATS3 on the scope and don't get the same results. Clean on the ATS3. Hmmmmm. I am running an older version of my firmware ATS3, BUT have a newer not yet released version on the ATS3A. So to eliminate the firmware, I should put the same firmware on each and see if that makes a difference....

I am assuming that Cam is using Steve's firmware as shipped, right Cam?

This is getting interesting... more to follow.

Hi all,

As some of you may know, I modified my ATS3 with the '3As T/R long Time ago (after Stevens hint). Schematics are in the pictures galery. Except a very rare occasion - often the very first changeover from T -->R I have very smooth response. What I try to say is . It's not this schematic in general that produces clicks. The only difference from '3A to my variant is : I have 10KOhms in the mute- and transmit- line either. Has some of you already examined the control lines? (MPU mute,transmit) in the critical moments?
A stupid question: Is the 50 OHms resistor in place , well contacted and has really 50 OHMs?

Hi all,

Last night I checked the firmware and that is not the problem. It is strictly an ATS3A unmute experience. Most prevalent with 40m filter but present with all filters. Not happens uniquely on unmute, so just listening to the frequency will cause the same thing. At the end of the freq announcement there is the click.

As I was lying in bed trying to sleep I realized that the 2 2n7002 FET's was another difference between the ATS3 and ATS3A.

I am thinking that it may help to have a limiting resistor and bypass cap feeding the gate of at least the mute FET just like Lutz's design. I double checked R20 -- it is fine (52 ohms on a cheap meter, good for me).

Anybody wanna confirm before I start cutting up my rig? Am I barking up the wrong tree?

Don't have a scope here at work but wonder if you can
see the click at the output of U2 (mixer)?

Here is another thought: Perhaps the mute line is
being coupled to the audio chain somehow due to
routing?

Topic: 263 Message: 270

Two points:
o The infamous click is present on several "QRP" rigs in a similar manner. I believe Steve even comments about that somewhere on his site. My SW-40 hurts my ears with headphones on.
o The click (as described in this train) is NOT present (barely discernible) in the ATS-3A I built. I would assume therefore that it is either a 'build up of tolerances' or some of us are just 'lucky' (not likely).

These comments are not meant to discourage further searching, but to suggest that a solution may require a 'creative solution' to be applied at the trouble source. Perhaps one that would be useful in other QRP rigs as well.

I think I see it on the outputs (pins 4 and 5) of U2 as well, but,of course, at a lower level.

There is very little click on 80, 30 and 20M, but it's somewhat pronounced on 40M (L1F, L2F and C3F have altered values on my 40M module, but I don't think that's a factor).

Very strange. There is definately a little burst of noise being generated after the mute switch goes high. It seems to be generated by the BFO mixer. I removed the coupling caps to the first audio amp and it goes away. Putting those back and disconnecting the input to the BFO mixer it comes back. I can not seem to figure out what the mixer is doing to produce the little glitch.

Something outside the BFO mixer area may contribute. If I simply yank out the 40M module (while the rig is powered), the thump pretty much goes away.

Perhaps Mike was on the right track when he mentioned that Q2 (controlled by the MUTE signal) is a new addition with the '3A. The band modules are a bit different as well.

Cam suggested to me that a 0.1uF from mute to ground helps (C57 would have been a great place to put it -- thanks Cam). It does help -- a lot. BUT as Dave suggested to me this interferes with programming the mpu from the jtag port. So it is NOT a permanent solution. Still wondering if a resistor in the mute line with a bypass cap on the Q2 side might help and still allow programming? I could put a sip socket at the programming point and have the bypass cap be removable for programming. This might just be what I do if no other solution is found.

Even with the bypass cap in place there is still a small click. Probably not annoying with a real antenna attached but there none the less.

I have been pouring over the datasheets trying to figure out why and am pretty much stumped.

One thought I had: The LO on 40M is almost exactly half of the IF so I thought that might have something to do with it so I put the LO on the low side for 40M (just like 80M) and it is still there and most prevalent on 40M. Have visually inspected the 40m board and nothing jumps out at me. Why does removing the board have the same affect as the bypass cap? This is a perplexing issue......

Another thought I had: while the FET ramps up there may be a time where the rf input causes the FET to "flicker" but what we are seeing is longer than that should be so I don't think that is it.

Very strange indeed.

Anyone else having any luck?

Powered up my ATS tonight and got what seems to be audio? I can hear a slight thump when I connect the power plug then a low hiss like the audio chain is working. But I don't hear the MPU ID? here's what I measured on the MPU and DDS

U6 MPU (volts measured)

P1 0V TEST (0) P20 3.5V MUTE (200mV)<<<
P2 3.5V V+ (3.49V) P19 3.5V DDS (.4V)<<<
P3 0V ST out (0V) P18 3.5V DDS (.4V)<<<
P4 0V GND (0V) P17 0V DDS (0V)
P5 2.7V osc (.6 V)<<< P16 0V Tx key (0V)
P6 1.7V osc (.5 V)<<< P15 3.5V Tunedn (3.49V)
P7 3.5V reset (3.5V) P14 3.5V MENU (3.49V)
P8 3.5V Dash in (3.5V) P13 3.5V band (3.49V)
P9 3.5V Dot in (3.5V) P12 3.5V band (3.49V)
P10 3.5V Tune up (0V)<<< P11 3.5V RIT (3.49V)

U7 AD9834 DDS (volts measured)

P1 1.13V FS ADJ (1.13V) P20 .75V IOUTB (.5V)
P2 1.17V REF out (1.18V) P19 .37V IOUT (.5V)
P3 3.54V COMP (3.60V) P18 0V AGND (0V)
P4 5.0V AVDD (5.0V) P17 .37V CMPin (.5V)
P5 3.5V DVDD (3.5V) P16 3.75V CMPout (4.4V)
P6 2.4V CAP (2.4V) P15 3.3V FSYNC (200mV)
P7 0V DGND (0V) P14 3.3V SCLK (200mV)
P8 1.7V 40 MHz (1.7V) P13 0V SDATA (200mV)
P9 0V Fsel (0V) P12 0V SLEEP (0V)
P10 0V Psel (0V) P11 0V RESET (0V)

Any clues? Steve/n0tu

I've been working with Steve on this, so I've had a little time to look at the data and symptoms. I suspect he needs a new crystal for the CPU - the CPU needs to work before he can get a sidetone and really drive the DDS. The tune up input is whacko but that may be a symptom of the CPU not running properly. He has checked the solder connections of the crystal to the board and the associated input pins to the CPU.

Hope this helps the 'real' experts ;)

From: Dave
Topic: 246 Message: 277

I desoldered Q2 and reinstalled it with a 10K resistor in series with the gate and a 0.01uF capacitor from the gate to ground. The thump is absolutely gone and JTAG programming is unaffected. (other than to also quiet the audio noise generated by TDO's toggling of the MUTE signal).

Watching the drain of Q2, it seems that there might be a charge that remains on C59 or C47 after the Tx shuts off and a fast switch of Q2 shunts it into the Rx with a thump. I'm not sure why 40M is most affected; perhaps some part of the Rx circuit just happens to ring at about 7 MHZ when thumped by that charge.

If someone else wants to try this, it might be worth checking that the change hasn't upset the normal operation of the QSK function. (I think it's fine though.)

> I suspect he needs a new crystal for the CPU

I agree that it seems that the processor's crystal circuit is not oscillating. Check for a shorts or opens on all of the processor's pins, particularly pins 5 and 6. That seems more likely than a bad crystal.

I posted this on QRP-L and thought I'd post it here also, in case some of the members here dont subscribe there..

Installing the 3/3A board in an Altoids can be a little testy, but easy enough if the mounting standoffs are glued in place. Don't be put off by the thought of it, check it out (link below). It's easy to do and works well for Rock Mites and and other projects too.

I'm still providing labels for the 3 or 3A. They're all over the USA, and some in Europe also. Please drop me a note if you're interested, they're free.

Details on both are here. http://www.wa0dx.org/wa0itp/ats3.html

That thump tells me that the MPU is working (it's the
mute line going high), which means the crystal is
good.

I would check from the MPU to the sidetone switch (U4
I think). Then is that is OK start checking the audio
chain. Do you hear noise from a noise generator? or a
signal source?

Hi Mike,

I'll have to check with Steve, but I am not sure if the thump heard is immediately after the power is applied (my ats and ats-3 do this) or is a few seconds late which would signal the completion of initialization and the startup message. If it comes a bit after power is applied, then yes, it sounds like the MPU is working. From his earlier readings, it seemed that mute was always low though.

Got more audio but no sidetone or ID yet?

UPDATE: I lost the thump on power up and now I get a
definitive 'click' but double the amount of hiss it's alot louder -I
also get lots more audio (AC hum etc.) if I touch a screwdriver to
the xtal filter now So I 'think' I fixed U4 the mute switch by
remounting it. Control P6 is lower than it should be?

U4 MUTE SWITCH
P1 2.2V Audio in (2.16v)
P6 3.5V Control (1.5V)
P2 0V GND (0)
P5 5V V+ (4.9)
P3 0V ST in (0)
P4 2.2V Audio out (2.2v)

Still no CPU ID or sidetone - reheated R12,C20/21 -no result?

Xtal voltages looks better now(below)

P18,19 and 20 look weird?

NEWS VOLTAGE READINGS:
-----------------U6 MPU-----(measured)----------------
P1 0V TEST (0) P20 3.5V MUTE (1.5V) <<<<
P2 3.5V V+ (3.5V) P19 3.5V DDS (.8V)
P3 0V ST out (0V) P18 3.5V DDS (.6V)
P4 0V GND (0V) P17 0V DDS (.3V)
P5 2.7V osc (2.8 V) P16 0V Tx key (.2V)
P6 1.7V osc (2.0 V) P15 3.5V Tunedn (3.49V)
P7 3.5V reset (3.5) P14 3.5V MENU (3.49V)
P8 3.5V Dash in (3.5V) P13 3.5V band (3.49V)
P9 3.5V Dot in (3.5V) P12 3.5V band (3.49V)
P10 3.5V Tune up (3.5V) P11 3.5V RIT (3.49V)

Any thoughts. Grasshopper is ready?

Steve/n0tu

It appears you found U4 was bad and I bet some of the other tiny 4
and 6 pin chips might be in wrong or not soldered. I suggest you just
check each of those tiny chips. I put them in wrong too.

Pin 16 and 17 don't look quite right either.

Do you hear any audio increase when connected to a
noise generator?

Do you hear any signals? (Nearby transmitter connected
to a dummy load).

If you click the menu button to you hear an audio
click after a few seconds? Monitoring the mute (pin
20) does it change during this procedure?

Connect a dummy load, then hold the dit or dah switch
down do you hear anything in a nearby receiver?

Several things could be happening here: MPU crystal
not working, MPU not working, DDS not working, Q2 not
working, who knows what else. I am not convinved that
the crystal is bad, yet.

Dave -

Sounds like a good fix!

Question - how did you do it, physically? Looking at the board, that's one of the tightest spots, Q2 nestled right up close to the band module socket.

I was thinking I might do it on the bottom side by cutting the Mute line just before it passes through the via on the way to the gate of U2 and inserting the resistor there.

Thanks,

Cam N6GA

I just did this mod on the bottom of the board. Not much room there either. :) I hope to get pictures up tomorrow morning.

I still have a click (audible and it shows up on teh scope). It is much less than before, but I don't think it is any less than the 0.1uf direct bypass discussed before. At least this way I can still program the rig and leave the resistor and cap permantly in place.

Dave can you see a small click on the scope with your mod?

This saga is hard to watch. Do you have access to an oscilloscope? You could narrow these problems down in a matter of a few minutes with the right test equipment. Static voltages only tell so much of the story. At the freq's used in the ATS3, any old scope would be fast enough.

Hey Steve;

The scope allows you to see signals as they propagate through stages. You can also see loading effects, open traces, shorts, etc., *and* see how the power applied 'to a stage (dc for instance) is being (or not being) used.

So....at the most basic level you can see if your oscillator is running, mixers working, dc getting from one place to another to run things, and if the various switches (like the mute switch) are working correctly.

I would start with the various RF signals being generated in the radio. I would also make sure dc was getting everywhere it is required.

Good luck.

You'll know it when you see it, HI. For instance, the clock
will be immediately obvious- it will be there or it won't.
You will see gain through amplfiers, and be able to follow
the output from the DDS through the buffers, PA and filters.
You can 'see' audio and adjust the tweakers for the correct
response. It's even useful for checking DC signals, from
checking absolute levels to seeing if there are any irregularities,
and for checking logic transitions. Checking the P-P voltage
across a dummy load you can measure output power. I can't imagine
working on a radio without one.

Pics of my version of this mod now posted in my photo folder on the
AT_Sprint group site. Look at the area below L3 for the resistor and
to the right of the resistor for the cap.

Anyone else checked out this mod on a scope?

I agree. It seems that the crystal is now oscillating, so the MPU is probably running now.

1.5 volts on pin 20 (a logic level) suggests a short that is dragging down the MPU's output on this pin and messing up the operation of U4 (or else U4 is backwards or now bad for some reason). You'll want to look at the first audio amp and the sidetone with the scope.

Careful when probing the AGC chip, U5. As mentioned here before, the pin numbering for that chip on the schematic is not correct; use the chip's datasheet.

Pins 18 and 19 go to the DDS chip for it's control programming. I would guess that the DDS chip is not getting programmed to generate the LO.

I think that once you resolve the Pin 20 problem you will hear the ID. You'll need to resolve the pin 18 and 19 problems before you will get the DDS chip to work.

I've been probing the audio at C18. I no longer see anything there when MUTE goes high, although I do see a bit there immediately prior to that (that shouldn't be getting past U4).

I think the remaining click might be from the switching of U4. It's the same with all band modules (and no band module). I'll bet that at this point the operation looks the same as it does on the ATS-3.

I was going to suggest a slightly different way of doing the mod. I probably would have installed the 0.01uF at C57, cut the two tracks on the bottom of the board going to JTAG pin 7, put the 10K across the cut from JTAG pin 7 to C57 and jumper the junction of C57 and the 10K to the cut track going to Q2's gate. Your way eliminates one of my cuts and the jumper at the expense of a bit more scraping of the solder mask (and I only have 1206 SMT parts in stock, making it tougher to fit the 10K where you did).

I just made the mod and I got the same results you did, Mike. The same residual click, very small. At the audio output it's measuring 20 mV P-P, which is quite a bit less than the sidetone.

I put in the resistor first, then checked to see what it sounded like. I got the results as described above. I then added the cap, clip-lead style and there was no discernable change. So I have left off the .01 cap for now.

297. ATS-3A antenna problem

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-08-15 02:04:03 UTC
From: Glenn Maclean
Topic: 297 Message: 297

I wrote to the group a bit ago about not hearing any signals on my recently built ATS-3A. I found out I had a short in my antenna system. I am using a Carolina Windom that is about 8 years old. I am on vacation this week with not big plans to go anywhere just catching up on projects and doing some day trips.

I finally was able to get outside today to see where my short was. I laughed my head off when I finally found the problem. At first I thought squirrels had gotten to my feed line this turned out to be not true.

We have a Gordon Setter 6 month old female puppy. She sleeps in the back yard against the back of the house. It turns out she has been very busy and chewed my RG8-X feed line in two where it enters through a house vent and goes to my basement where the shack is. No wonder I could not hear any signals!!!!!!!

I am still laughing.

IMHO too high values of capacitors should be avoided in this place
especially in conjunction with no or too low series resistors. 1nF is
sufficient to short all garbage there and a 10K R should do.
BTW: I 've accidently put a 200KOhms 0805 resistor into the mute line
having noticed no disadvantages at all. (Have realized it much later).

Depending on whose datasheet you look at, the 2N7002 has about a
20 to 50pF gate capacitance and this is apparently sufficient when
combined with just the 10K series resistor. It seems to me that
any additional capacitance would just further delay and soften the
switching of Q2. The important thing is that the delay is short
enough that Q2 is fully switched off before the PA is activated.

I guess I lied when I said the thump was "absolutely" gone. What
remains is a slight click. At C18 it's nothing like what was there
before. However, U5, the AGC chip, does seem to amplify this click
to a significant level.

As far as I can tell, the source of this click is the 5V power.
I can't see it at all on the input to the first mixer, but the
click is present at its output. A click of about the same
amplitude is present on 5V.

Dave

What seems to have eliminated the mute release click for me was changing C54 to 100 ufd. You can tack a 100 ufd cap across the existing C54 and lay it down over the regulator.

Somehow I blow out Q2 playing that area, so I'd try the 100 ufd fix before anything else. Also, removing L3 and the coupling cap from the LPF to Q2 didn't affect my click any, so I don't think its coming from there. A little bounce in the 5V regulator is more likely.

Yup, that eliminated the remaining click on MUTE release for me.
On the downside, the 100uF 16V cap that I used added almost 0.7% to
my station weight, so I'll be replacing it and C54 with a smaller
100uF.

Steve -

The pinouts and voltages on page 23, the IC voltage charts, are
correct. It's the pin numbering on the schematic that's not.

From: camqrp
Topic: 313 Message: 313

This one falls into the "leave well-enough alone" and "if it ain't broke....." bin.

Having pulled C54 and replaced it with a 100 mF cap, I got greedy and pulled it to replace it with a 220 mF cap. Could have just tacked another 100 on the bottom of the board, but NOOOO, somehow I thought it would be a "cleaner" installation this way.

You can only heat up those little pads so many times. I ended up lifting the pad and the plate-through from the bottom side of the board, so the new cap had nothing to solder itself to. So I had to lay the big 200 mF on it's side on the top of the board so that I could get to those pads for the soloder job. Now it really looks tacky, but that click is very much gone.

Speaking of which, Thanks! to all of you who pitched in with help on the problem. This is one great group of hammies! My ATS 3A is really runing smooth now.

72/73,

Cam N6GA

Hi Gang

Just joined the group and thought the you might like to hear my building experiences. First of all, the rig is working on 20M, without optimizing the calibration, with some help from W1MT. Haven't completed the other band boards yet....those darned toroids! About 3.5W out with 11.8v in. Used Norcal's PCB holder...highly recommended.

I managed to solder U7 the wrong way around and so removed it with fine wire under each leg. In handling it with fine tweezers it flew off into never-never land and was lost. That's kinda surprising considering it's size. That's a $15 error! I also lifted the PC land on pin 20 and now have a fine wire link to R16/C33. Lesson learned - don't use tweezers except for perhaps handling away from the PCB and then very carefully, and off course, double check the chip orientation. My final method of transportation and mounting was with an exacto knife and beeswax (thanks Steve).

I also had R10 fly off and overheated the replacement from Steve.It measured about 600K instead of 267K. Rather than go back again to Steve I replaced it with a 270K 1/4W regular resistor. (Frys here in TX didn't have 1/8W).

Going to use it exclusively for SS so weight saving is of the essence . Not decided on an enclosure yet but it's hard to beat W1MT's balsa method. Using an early version of the Te Ne Key paddles so have to improve on those. Post is a bit long but thought it might help somebody.

I was an early ATS-3 builder and there were not many other guys on the air with one. I got mine working but not quite right. There was something not working right and I asked Steve. He said send it back to him which I did and he found I had mounted the multi load resistors chip backward (I didn't know there was a backwards).

Since then I have had nothing but fun with the tiny rig. It has flown almost around the world. I got several Hams interested in it because I would use it for all the QRP contests like the Fox Hunts and Field Day. I worked 3Y0X on Peter One Island using the rig. I sent that gang a picture of it. They really enjoyed the the irony in their big ICOM working the tiny radio.

I did well in the Summer Fox Hunts this year. In fact an idiot on the Fox Committee accused me of running too much power.

Okay...so I have to ask since I've brought this up on here and on QPR-L before. What brand of tweezers are you using? How much did you pay for it?

I have always used a high quality set of tweezers (acually tongs) designed for stamp collecting. I prefer Showguard #908. sharp tip, 6 inches long. They have a nice heft to them and are very stable. About 8 bucks from a stamp supply dealer. A google search of "Showguard Tongs" will tun up many vendors if you don't have a stamp shop near you. (fewer and fewer of us do!)

From: Bruce Beford
Topic: 319 Message: 319

This came up on qrp-l last night, so I thought I would post my
response here as well.

Kurt Loken wrote:

My favorite example of this technology being used for
a function in a QRP radio is the Panasonic ALC chip in
the ATS-3A that I recently built. Is anyone using
this radio missing a volume knob?

Kurt:

By this, I wonder if you mean you WISH it had a volume control? If so,
Radio Shack carries a nice short pigtail for your headphones that has
an in-line volume control. I use one on my ATS3 and 3a. Works great,
and costs about $8, IIRC.

It's a network. One common, with multiple pins
for the individual resistors. You would've ended
up with only one pin being properly referenced, with
the remaining gates/switches being weakly pulled to
whatever the one referenced pin was, depending on
it's state. Unpredictable, to say the least.

> I worked 3Y0X on Peter One Island using the rig.

That's fantastic.

Hello Bruce,

Oh my no...that is not what I meant. I love it. I love not having a volume control. I find the listening experience on the ATS to be very comfortable.

I guess I was trying to communicate that here is a case where leveraging cell related technology made a better QRP radio.

Sorry if I wasn't clear.

hi

for the crystal filter mods at
http://www.w1mt.qrpradio.com/filter.html
apparently you can fit in a surface mount inductor if
you tee-pee three parts together at the input to the
filter with c6(100ph) and the 220pf going to ground.
have not seen a picture of this and i am not sure what
others have used for the inductor.
Craig NR4E offered the component kit but i did not grab one.
if you know what was used for an inductor please let me know.
also if you have a picture of the tee-pee mod could you please
post it to the groups "photos"
thanks

for 40 meters with the murata filter at
http://www.w1mt.qrpradio.com/dl2hrp.html
at the bottom of the page, i think that everything to
the left of pin 6 stays the same and that pin 6 is
still connected to everything to the left of it where
it connects to "c5" (that has changed to 37pf). ie connected to
c1f and l1f etc leading to pin 7.

does that seem correct?

thanks &72

absolutely right, provided you still have the original T/R series
circuit plus diodes in place. More generally: The matching of the
ceramic filter consists of two T- circuits The lead in of the first is
C5 37pF. The lead out of the second T is the 22p Capacitor on the main
board. One of the 10uH SMCC inductors is the first inductor. You may use
a SMCC 15uH , SMD 15uH or 56T on AMIDON T30 for the second. Put the
ceramic filter to the place where L3F once resided. You have to drill at
least one additional whole. There is no adjustment needed. I tried to
keep the Qs low.
Good luck in building. The result will be quite amazing...;-)

I'm writing an article for the local ham radio club newsletter and I'd like a little help. The article is about creative and innovative designs for housing homebrew projects like the Sprint. Many of you have come up with different designs and I'd like to borrow pictures from the archives to illustrate the article. I'd also like to ask some questions of those who agree to be involved. If you're interested, please post your comments here and I'll contact you by email to make the Q&A easier. I will list each member's information (for those who participate) in the article and will let you know when the PDF version of the newsletter is online. I am also the newsletter editor for the Pikes Peak Radio Amateur Association (PPRAA). This issue should be out by September 1.

Thanks in advance for your help. I am really impressed with the pictures of your projects and with the helpfulness of all the members here and look forward to showcasing your projects in the article. I have learned so much from reading all the posts here and avidly read through every single word from all the posts.

72 as always...

342. ATS in a tin (batteries not included)

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-09-03 01:12:18 UTC
From: Steve/n0tu
Topic: 342 Message: 342

I just burned a few hours putting my baby in a tin. Drilling tin take time and slowly stepping up in drill sizes before you get to the step drill! I used some colored tape to punch out some dots for labeling the buttons for now. I'll make up a label with integrated abbreviated cheatsheet later since this old goats memory is kinda weak! Posted a photo. Will post more later. I'm finding I'm using the ATS more than any other radio I own ...I love this thing! What an amazing little rig! Gotta go to melt solder on that 80m module it's getting dark out!

Topic: 343 Message: 343

Greetings,

I've installed a different tuner in my ATS-3 (check out the photo in my batman tin photo section). The ALT tuner designed by Steve, KD1JV, was slightly modified to permit the possibility of tuning on 80m with an end fed wire with counterpoise. I added a 15.5 uh coil and jumper. Also, I've not added a bridge tuning/coupling circuit yet in my tuner - I thought I'd see if my wire setup was repeatable enough to just go by what the MFJ analyzer told me and then peaking for audio in the field.

Yesterday, I was able to make several QSOs on 40/30/20m on a 45 ft end fed wire mounted near vertically in a nearby tree. The setup is fairly repeatable and the audio peaking seems to be working, so I will save the additional weight for now. Also, the 45 ft wire tunes up fairly well on 80m, so it works on all the ATS-3 bands.

As a little tidbit of information - the Fuchs tuner I had built previously seemed to attenuate signals significantly on 20m. On a four day outing on the Colorado Trail with Steve, N0TU, we were unable to make ANY QSOs at all on any band while we were out. I may revisit the Fuchs tuner to see if I didn't have some "off brand" toroids in it - I really liked the way it tuned up easily, but if you can't make contacts, easy tuning is no advantage.

From: Daniel Lautenschleger
Topic: 344 Message: 344

I finished assembling the main board of the Sprint ATS-3A and I can barely hear the "20M" announcement when power is applied. The keyer sidetone is barely audible as well. I tried several different headphones and my iPod buds seem to be the loudest.

All voltage checks mentioned in the initial tests/alignment are right on. Any assistance of where to troubleshoot would be appreciated.

-Dan, AB9ME

Some more information:

I checked the voltages of U4 and U5 and it appears that I
have audio out voltage (.96V) on pin 3 going to the C19 capacitor
which feeds the audio input of U4 the mute switch. Problem is, there's
no .96VDC on the other side of C19 and thus no 2.2VDC on the audio in
pin of U4.

Solder looks good on both sides of C19. Is there a possible bad
capacitor involved? I wonder why the voltage after going across the
capacitor would actually go higher to the supposed 2.2VDC?

This has to be the suspect area.

348. Processor noise in Rx

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-09-05 04:55:57 UTC
From: Dave
Topic: 348 Message: 348

Has anyone else noticed any processor-related noise getting into the Rx? I've notice it sometimes on 20M where it varies with whether or not I have a control button depressed (consequently changing the timing through the various software loops) and where I'm tuning in the band. It actually seems quietest when holding the Up or Down button.

I'm running a modified version of W1MT's software, so the timing through some of the software loops may be unique to my rig. It's possible that other software variants would have different characteristics. I also have slight tweaks to the hardware in the component values I have in the band modules and the changes previously discussed to get rid of the unmute thump.

Yesterday I hooked up my earphones and Bencher paddle to my ATS-3
and powered it from a big car-starter battery. I was really chubby :-)
but cared not.

I used my Elecraft T1 tuner and worked both 20 and 40 meters. Both
bands were open so it was fun, and the ATS-3 worked without a single hitch.

I too played in the Sprint. Using someone else's ATS3
that I had at the house at the time. I weighed in at
0.415 pounds, which is quite chubby for me. :)

Had a good run on 80M. 17 q's in one 30 minute
stretch. 80M is getting back into shape for the fall
and winter.

Bert:

I have an ATS 3 that I bought from Doc K0EVZ about a year ago, and I've had it on the air once last fall (works fine). It was hand-built by the designer himself, Steve Weber KD1JV, especially for Doc. Doc says the filter was hand-tuned to provide a narrow response, but I can't vouch for that (sounds about like my ATS-1, which is indeed pretty narrow). I can send some pix, if you're interested. There is half a picture (second row, far right) on my "Altoids" page:

http://www.dit-dididit-dit.com/altoids_display.htm

I have an ATS-1 that I built myself, that I'm partial to (because I built it), and I also have a K1/4 that I built, so I end up using those, and not using the ATS3. Hence, I'm willing to part with the ATS3.

354. Re: Processor noise in Rx (or not)

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-09-05 22:15:43 UTC
From: Dave
Topic: 348 Message: 354

You know, I really don't know if this noise I'm hearing is processor related or not. I beginning to think it's not. It seems to change with whether or not I have a tune up or down button depressed, but I can't seem to determine a pattern. Sometimes the noise is there, but usually not. Sometimes it happens only when the tune button is down and goes away when the button is released. Other times it disappears when the tune button is down and comes back when the button is released. It seems to disappear entirely if I tune away far enough, but sometimes doesn't return when I tune back. Usually it's faint when it's there at all, but sometimes it's louder. Sometimes it will fade out by itself.

It's really strange. I would not have distinguished it from normal background noise except for its tendency to change with a press or release of the tune button.

Monty,

I think I may have jumped the gun as to what I was looking for, but I'm not sure. Is your ATS 3 the 3 band or 4 band model ? I think I should have specified ATS 3A.

In either event I am interested is seeing some pix.

Thanks,

Bert

Hi John,

I've been thinking about tuners as well.
Have no idea what works.

If no bridge is required, perhaps a fixed
inductor could be installed on each band module
of size appropriate to the long wire you typically use.
Tuning is then carried out in the field with a variable
cap common to all bands, could be inside the rig or at
the antenna connector.

A shorting plug across the inductor would allow
this feature to be disabled.

But if the bridge is required, this won't work so well
as the bridge should be between that new inductor and
the rest of the band module.

If a bridge is required, perhaps it should be set up
as a sensitive one powered from the battery. Then borrow
a few microwatts of RF from the output of the DDS filter
when tuning up.

Hi Jerry,

I like this idea a lot. Maybe I could install some pin sockets and
just plug in some inductors temporarily to see how it works. I'll see
if my ATS-3 with HB ALT will be consistent enough for me when I go out
yet again on the CO Trail tomorrow. If so, I can shave more weight
and dimensions from my setup.

Tnx for the ideas es 72 - john - n0hj

Yes, I belive it is. It might be coming in through the mute port connected to the T/R switching fets. I'm thinking of trying to put the processor into one of the sleep modes or changing the internal oscillator frequency while its just doing switch scanning to try and eliminate it, but haven't had a chance try it yet.

From: Bert Morton
Topic: 364 Message: 364

Can anyone offer any thoughts re: this problem ?

Thanks,

Bert

Monty:

RIT was my first thought, but that wasn't the case.

It does appear to have some output, but it's difficult to tell really whats going on. I tried using my MFJ QRP tuner, but the metering is flaky. I'm assuming that's because it's perhaps on some oddball frequency. I can't "find it" as I mentioned using my frequency counter.

I tried it this morning with the 40 meter module and a frequency check using the menu. The CW response is T4TRT.Still assuming it should be on 7040 I found it on the outboard receiver on 7185.

So far using an antenna I haven't heard any signals as well.

Hopefully Steve can shed some light.
.

I have not heard of anything like this before. Here
are a few questions:

What is your outboard receiver?

Have you tried recalibrating the ATS? The manual can
help you there or check out my webpage at <
http://w1mt.qrpradio.com/ats3calibration.html >.

Depending on how old the rig is, it may be worthwhile
to update the firmware and then see what is happening.
It might clear it up.

Hi Mike, I agree but let us be careful too. I think we need this
information:

1. Did you build this ATS3? How many years ago?

2. Is it a ATS3 or a ATS3A?

The first step is to use the manual and do a complete re-calibration
on the radio. Everything should tune proper and when done you should be
able to install the 40 meter module and hear the transmitter on another
receiver on 7.040 MHz. With the ATS3 listen while a external transmitter
keys.

If all this works go to the manual and tune up the 80 through 20
meter modules as explained. If it doesn't tell us what went wrong.

NOTE: This is peculiar to the ATS3A only.

Yes, this does seem to take care of the noise. I heard the noise as an increase in RF static, not beeps and boops of the processor. Could never get it to occur on demand but on the modified rig I have not heard it in 8 hours of listening on a dummy load so I am fairly well satisfied that it is gone. I have posted a pic of the mod in my folder (you can see the mute line and T/R line mods in the pic).

Some may not notice the noise level rise at all. Only after corresponding with Dave over the last week or two did it become noticable to me.

Yeah, blame me. :)

Since the mod, the noise has not returned for me either. In fact, the
Rx seems generally quieter (or maybe it's my imagination), so I'm quite
satisfied. I'm running out of things to poke around at in the rig.
It's been a great help in learning how the thing works.

Dave

371. Battery packs - long, skip if you've heard this before.

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-09-15 22:21:08 UTC
From: camqrp
Topic: 371 Message: 371

Once the solder smoke cleared and my ATS-3A was alive and well, it was time to turn my thoughts toward a power source for the little beauty.

Coincidentally, I stumbled on a vendor at the local swap meet who was selling 2700 mAh NiMHs for $2 apiece, or 12 for $20. Doing some quick mental calculations, I arrived at the conclusion that that would be about 8 batteries for the ATS-3A and something like 4 left over for my digital camera. (Quick Mental Calculations and Saturday Mornings being mutually exclusive here...)

SO money and batteries changed hands and I was off to find an 8-cell AA battery holder. None showed up so I went to the local Radio Shack where none were found, either. They did have 2 4-cell holders, so I bought those and a couple 9 volt battery clips. After soldering the whole array together and giving the NiMHs a good charge, I put the rig on the air and began churning out the contacts.

All well and good, except that the wattmeter said I was only putting out a bit over 3 watts. I was expecting at least 4 watts out at 10.5 volts, so I started checking into things and discovered the key-down voltage was dropping to something like 9.0, or a drop of 1.5 volts.

To make a long story longer, the culprits turned out to be the contacts inside the battery packs and the 9 volt clips which attached to the tops of the packs. Especially the snap-on clips on the tops of the packs. These things are very cheaply made, and in the presence of some decent current draw they go weak at the knees.

So I scavenged another electronics parts store and found some 4 cell packs that had solder tabs for connectors, and the batteries were arranged so that there were two pairs of batteries lined up end-to-end so that they contacted each other directly with no middle-man contacts in between. The result is only a .5 volt drop on key-down, and 4 watts output from the ATS-3A.

I know, I know, the guy on the other end won't be able to hear the difference between 3 and 4 watts. But as long as I'm drawing that kind of current from the battery pack, I'd prefer it to be going up in RF radiation rather than heating the battery pack parts.

72/73,

Cam N6GA

A schematic fo rhte T/R switching is in the photo section under DL2HRP. Lutz had posted this regarding a different QSK scheme for the ATS3. Steve/KD1JV incorporated it into the ATS3A, but left out the resistor and capacitor on each line (mute and t/r). Turns out the solution to the "processor noise" appears to be to put the resistors and capacitors back. You can see where I did it by looking in the photo section under W1MT.

I would say that if you don't hear the noise, then don't do the mod, as it involves scraping the mask on some traces and cutting traces that are mighty small. Not impossible, but not as easy as soldering smt. :)

The noise sounds like static to me. I was watching on spectrogram one day and it just seems like a 10db increase in the noise floor at random times and durations.

Hope this helps.

375. Lipo warning

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-09-16 17:47:18 UTC
From: w1mt
Topic: 375 Message: 375

While troubleshooting recently I left my 3 cell lipo battery hooked up to my ATS rig all day at work. At some point it went below 6 volts as I heard a terrible oscillation in the earphones on the rig. Unhooked the battery and tested with a voltmeter -- 4.95 volts. Uh oh, not good. (A 3 cell lipo should never get below 7.5 volts absolute minimum.) Charging won't work as the charger is sensing that it is a 2 cell pack. nothing to do now except take the battery apart and try to salvage 2 of the cells. :(

So, monitor you lipo's and make sure that they don't get below 2.5v per cell!!!!

From: aardvarq
Topic: 376 Message: 376

Hi all,

My best plan to pick off the LO output by the DDS for measurement by a frequency counter (1 M ohm input) has gone bust.

Where is the best place to do this?

TP1 = only has output when in CF mode
Between L1 & L2 = 270 ohms to ground = no signal measurable by my counter
Between pin 19 & 20? = 2x270 ohms to ground = ??

Thanks
-Dave

>Where is the best place to do this?

Is this to be a permanet connection? The best place to connect is the output of the DDS filter, which should have about a 500 mv p-p signal. If this isn't enough to drive the counter, you'll have to somehow increase the sensitivity of the counter.

If you just need more level for testing or checking the LO frequency, than tacking a 2.2 K resistor across R19 (the 3.9 K above the DDS chip) should boost the level up enough for the counter to read at the output of the filter. I do that when I want to use my counter with a X10 scope probe connected to it. The 2.2 K should be removed once the measurment is done, as the resulting level caused by leaving it in will overdrive the mixer LO input.

I STRONGLY suggest that anyone using or considering LiPos for power incorporate under/over voltage and overcurrent protection. Small PC boards are now available for this purpose. see the offerings at all-battery.com for examples:

http://www.all-battery.com/index.asp?PageAction=VIEWCATS&Category=178

I am a happy user of these products- that's all. (And, they are on sale right now).

http://groups.yahoo.com/group/AT_Sprint/cal

Run for the Bacon
Sunday September 17, 2006
6:00 pm - 8:00 pm
(This event repeats on the third Sunday of every month.)
Location: Your shack or anywhere

Notes:
This Sunday evening, the Flying Pigs Amateur Radio Club International
will be holding its monthly Run For The Bacon. This is a friendly,
two hour QRP CW Sprint, which is open to ALL radio amateurs, will last
from 9:00 - 11:00PM EDT (0200-0400 UTC Monday).

You may work stations once per band on 160, 80, 40, 20, 15 or 10
Meters. Suggested starting frequencies are 1.812, 3.562, 7.044,
14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs
membership number. If you're not a member of the Flying Pigs, and
would like to be; then please cli

380. ATS-3 & Norcal QRP FCC-1 (Frequency Counter) Integration

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-09-19 07:57:26 UTC
From: aardvarq
Topic: 380 Message: 380

Hi all,

I just finished my integration of the ATS3 and the FCC-1 (http://www.norcalqrp.org/fcc1.htm). Both are mounted in a LMB-139 (5.5x3x1.25") box and it is configured to function as either a standard frequency counter (ignoring the ATS), or as a digital dial for the ATS. It sure won't win any Spartan Sprints, but I have a feeling that it will come in handy.

For those of you who are interested in this, I just posted a summary document called "ATS_FCC-1_Integration_manual_v1.pdf " under the files section of this group. I also posted some construction photos of this new box as well as my original Whitman's tin ATS-3 under the AE6RQ directory.

Many thanks to Steve, Mike, and Bob Okas of Norcal QRP club for your great designs and assistance.

-Dave

382. It's Alive!

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-09-21 01:45:25 UTC
From: blammy8
Topic: 382 Message: 382

One more 3A is alive :-)

I used the vaseline/solder paste/hot air method for mounting the SMD parts which after awhile, I grew to enjoy for goodness sakes.

The only build problems I had were (of course) related to solder connections either not fully heated or bridged. Let me tell you...there's nothing like removing solder bridges from U7!

Oh, and I soldered LF3 incorrectly on the 20M band module. I still need to refine the alignement a bit but all voltages mentioned in the manual with regard to the ICs are almost dead on.

SIP pins were missing from the kit, but a SASE to Steve produced not only the pins, but a 100uF capacitor to replace a 2uF near a voltage regulator (help with key thumps?) and an additional 10uF capacitor that I manged to smoke when reheating solder joints around U4. Nice guy! He even threw in some more magnet wire for the unbuilt band modules I still need to assemble as some folks have reported running out of.

My test setup is not ideal for measuring power output:

1. I'm using 3' long pieces of #20 hookup wire for antenna connections to an SO-239.

2. The dummy load is connected to 50' of RG-59 cable.

3. For receiving I have an 80M dipole that I cannot tune with my antenna tuner because my HF rig is in the shop :-)

At least I have access to a WM-2 :-)

With 9VDC I am measuring .8W forward and .2 reverse.

With 12VDC I am measuring 3W forward and 1W reverse.

Considering antenna is not matched and radio not properly aligned, I can hear 20M CW very well and it's about 8:30 p.m. CST where I'm at.

I think with a nice (short) chunk of LMR-100 replacing the #20 wire for the antenna, using a dipole tuned for my receiving frequency, and doing a better job of alignment, this should be a pretty cool radio that I built for a good ham friend.

Question: Are others getting the 2.5W on 20M with a 9V battery that is mentioned in the manual?

Will report back when all is tuned and it's in the box!

383. ATS-3A Power out

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-09-21 02:07:57 UTC
From: Rob May
Topic: 383 Message: 383

Since AB9ME asked, here's what I get from my ATS-3A at 6, 9 and 12 volts from a regulated bench supply:

	6v	9v	12v
20m	.87w	2.45w	4.09w
30m	1.1 w	2.70w	4.66w
40m	.81w	2.01	3.60w
80m	.91w	2.29w	4.35w

Don't exactly know why it's a little low on 40m, probably in the filter board. I'm very happy with the way this radio has turned out. Anyone else want to throw out some numbers?

Topic: 383 Message: 386

Hi Rob,

mine was a bit low on 40m too originally. I applied Davids W6EMD LP mods
and got well over 3W with 9V. For 40m its C2=820pF C6=470pF.
There are more radical improvements of the PA match around ,but they
definitely should not applied to rigs that run on 12V.
As Steven said - the PA match is a compromise between good match and a
sturdy response to PA mismatch. Mine is a 9V only rig and I get at least
3,4W out of it with 9V.

387. Thoughts on RTTY Tx

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-09-23 18:42:46 UTC
From: Dave
Topic: 387 Message: 387

I've been giving thought to what it would take to implement RTTY FSK within the ATS-3A (and with suitable tweaks probably would work in the -2 and -3 as well). Looking at the processor clock speed, it seems that no matter how efficient the code, programming the DDS's frequency register or commanding a frequency-register switch would take about half a bit time at 45 baud. That's way too long to work because it means that the incoming bit stream (applied, say, to one of the paddle inputs) would get sampled at most only twice per bit time, far too infrequently to maintain accurate bit timing.

That seems to leave using the FSELECT input of the DDS chip as the only viable way to implement the frequency shifts. My thought is that during Tx, a relatively tight loop, say, the existing straight-key loop, would sample the incoming bit stream and pass it to FSELECT. That leaves the question of how to control FSELECT. That could be done by tying it to either the SCLK, SDATA or FSYNC signal going from the processor to the DDS chip (1 pin lift, 1 jumper). It seems that any one of those lines could be toggled without upsetting the DDS chip as long as the other lines stay quiet. In fact, I think that if either FSYNC or SCLK stays quiet, both of the other lines could be toggled (certainly easy enough to test before modifying the board). There is no need to program the DDS registers during Tx, so the dual use of one of the processor lines would not create a conflict. As long as the T/R line is off and MUTE is active, the frequency-register switching that happens during the command to enable or disable the FSELECT input would go unnoticed. Using the FSYNC line as the dual-purpose signal would minimize that switching.

Apparently the DDS chip maintains phase continuity when switching frequency registers, so that's not a concern. Also, some wording in the DDS's datasheet regarding not meeting set-up times suggests that the FSELECT input signal being asynchronous with respect to MCLK is also not a concern.

Since the current code uses one register for the Tx frequency and the other for the Rx LO, the Rx LO value would have to be restored to the DDS after Tx is switched off.

Does it sound like it will work? Has anyone else done such an implementation? I know there is a document in the files section that describes using a partially-populated (no processor) ATS board with the DDS controlled directly by a PC. I'm talking about an implementation with minimal change to the ATS that retains all existing functionality.

Dave, WA3OFF

Oh, Roland,
I heard from Mike earlier:
- - - - -
Hi David,

Your Yahoo ID is yours and not related to the
AT_Sprint group. You will have to change it yourself.
Looks like the last update you made was in 2003. You
were probably 71 at that time. :)

Your email shows up because you are logged in. Others
can see theirs but not yours. This helps keep spambots
from harvesting the addresses.

Hope you enjoy the group! Glad to have you aboard.

73 de w1mt
mike (one of the mods)
- - - - --

I did change my age, too! So everything is either fixed or understood
now. Thanks again.
Dave

Topic: 387 Message: 390

>DDS's frequency register or commanding a frequency-register switch
>would take about half a bit time at 45 baud. That's way too long

The delay in switching the F registers is the same going one way as it is going the other, so it simply time shifts the output in respect to the input keying signal. So long as it competes the task early enough to look for the next baud bit, there is no problem.

Thanks Steve, I came to that same realization myself. I had
originally figured that I would update the output frequency on evey
pass through the loop, but as you pointed out, it's really only
necessary to update it on the changes between Mark and Space,
eliminating my concern about the sample rate. So, although I
think my original method would work, the hardware change is
unnecessary and control of the frequecy shift can be implemented
fully in software.

Dave

My concerns about the sample rate were entirely unfounded. Somehow I had it in my head that the processor clock was running off of the watch crystal when in fact it's running off of the processor's 4-to-5 MHz internal oscillator, about 140 times as fast. That's plenty fast enough to do the frequency switching in software by writing to the DDS registers. Even if I chose to do it by writing 32 bits to change the value in the Tx frequency register, it would only cause about 1/100 of a bit delay, about 1/200 of a bit slower than writing 16 bits.

Gang,

I'm working on an article (hopefully for publication in a magazine or journal) that, among other things, makes reference to the ATS-III. I could really use a cool picture of an ATS-III packaged in an Altoids tin or some other cool package. Anybody have one that they'd allow me to use (with full credit to source, of course)?

If you have one that you'd allow me to use, just stick it in an email along with any information about the rig that you think would be interesting and a mention of who took the picture so I can credit it properly.

Thanks in advance for anything you might be willing to throw my way. I realize that this Yahoo group has a photos section, but it wouldn't be proper for me to just swipe one without obtaining permission from its source.

Oh, and the reason why I can't take one for myself is that I don't yet own an ATS-III, only a -II... Come the next round, though, watch out!

Here is what I generally use in the field.

50'/17' wires gets me on 40/30/20 with a tuner.

a 100'/34' combo adds 80.

I like to get the shorter wires off the ground --
sometimes even parallel to the longer wire but always
off the ground. You will recognize these as 20m and
40m zepps. :) They work fine for me. Again, I use
tuners (generally an Elecraft T1) for best match.

412. Output Pwr

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-10-18 05:37:10 UTC
From: Tim Keene
Topic: 412 Message: 412

I have a question for Steve and the group. I have an ATS-3. My pwr out is low on the default qrp freq. On all 4 bands the best output is up approx 200kc. Sometimes this is a considerable increase such as on 20m from 1w on qrp freq to about 3w on 14.200. My question is should I try adding one or possibly 2 windings to the filter board toroids to bring it closer to where it should be? Did I incorrectly count the windings when I made them? Although it is not that big a deal, I would like to get my output pwr closer to where it should be down in the CW band. Any info would be appreciated.

1 or 3 watts are low if your using a 12 volt battery. Did you do the
part of the setup where you move the coils a tiny bit and maximize the
output to about 2.5 watts with a 9 volt battery? You do this on the
frequency the radio comes up, which is like 7.040 MHz?

If you follow the instructions and you can't get even close to 2
Watts with 9 volts on ANY band then there is a problem with the FET
stage. If you get 2 watts on at least one band than it's a tuning
problem with the plugin boards.

Read the Manual :-)

Hi Tim,

What power supply are you using? I will assume 9v
given the powers you mention.

In order to get 2.5 watts out I have tweaked 3 of the
4 band modules on most ATS rigs that I have built.
Some have less turns most have more turns. Because of
winding differences among builders, I think most can
be tweaked a little to help with power out. It will
take some experimenting. Be careful though, it is
possible to get TOO much power out. I would not adjust
for more 2.5 watts at 9 volts or 5 watts at 12 volts.
If you know that you will never operate it at more
that 9 volts the go ahead and tweak for peak. :)

On the schematic its LF2 that I had the best luck in
tweaking.

From: Dave
Topic: 412 Message: 416

On my ATS-3A, 40M and 20M had output below that of the 80M and 30M modules. Testing the unmodified modules showed peak output at a considerably higher frequency than that of the CW bands, as much a 1MHz higher. On 40M I added 1 turn to L1F, 2 turns to L2F and changed C3F from 100pF to 83pF. That brought power from 3W to 5W using 12V. (I actually played with C3F a bit as saw 7W momentarily, tuning based on http://www.arrl.org/tis/info/pdf/010102qex009.pdf). On 20M I added a turn to LF1, removed a turn from LF2 (made it 14 turns; you would need to add a turn on that toroid of an ATS-3 20M module to get 14 turns) and increased C3F from 33pF to 43pF.

The results from running these values through a filter calculator indicate that these values produce a bit lower input impedence and a better-placed notch at the 2nd harmonic. That assumes that the toroids' permeability specs were correct; I understand that they can vary some. They also seem to line up somewhat better proportionally with the values used on the 80M module.

I found no difference from changing the turns spacing on the toroids. Apparently this mostly changes the inter-turn capacitance. Mine were wound tightly enough that I couldn't really change the spacing that much.

Dave, WA3OFF

Tnx for the info and I will give it a try when I am in the mood for experimenting. I'll report back some of my findings if any works out. By the way, I generally use a flat velvet jewelry case with 8 2500maH NiMH AA batteries for my power supply so when fully charged it is around 10-11 volts. I also occasionally use a Planter's Cashew can (I think cashew electrons are better than peanut electrons HI HI) with 6 Hawker Cyclon, 2v, 2.5AH batteries which is a little better than 12v supply. Maybe I will post some pictures later. Tnx agn for the info.

ATS Gang-

I've just started work on a new accessory for base station use of the ATS rigs. A lot of you have been asking for a digital frequency readout for the rig. I figured if we're gonna do that, might as well throw a few other handy things into it as well. So, it combines a frequency counter, a power/SWR meter, an audio amp, a 6 to11 volt variable voltage regulator and fits into a NorCal BLT box.

I hope to have the prototype up and running in a few days. Then I'll figure out what it will have to sell for. If everything goes well and there are no back ordered parts, could have these ready for sale by the end of November. Sound like something you'd all like to have?

Steve,

will the freq counter sample the rig output or will
rig mods be needed ???

Answers to questions so far:

>How about an encoder to change the frequency?

Not practical, for a number of reasons.

>and space for the NEQRP NESCAF
>
Looks like there is room to mount one on the top cover of the BLT box, but not enough room for the controls and in/out switch. I suppose those could be mounted to an "L" bracket mounted to the top of the cover.

>will the freq counter sample the rig output or will
>rig mods be needed ???
>
You will have to add another RCA jack to the side of the ATS tin to sample the DDS output. The counter will automaticlly adjust for the 80M band by determining the LO frequency.

>> fits into a NorCal BLT box.
>>
> Do we need to order this box ourselves?
>
Probably. If I have to buy the boxes and send out to have holes drilled and the display window cut out, it would add considerably to the kit cost and delivery time. There's also a good chance many will opt to package it differently.

I will order a box soon. I think the encoder for frequency change
sounds nice and is worth a look.

I don't have a feel for how this will look. Will the ATS be on top
of the box mounted there with screws? That sounds like it must be if we
use the switches as before? There will be a power and DDS output and
audio line running between the box and the ATS, so I will need to think
about this.

I was excited about the once proposed ATS-4, wanting a base station version of the ATS-3. Now that Steve is offering this option, I'll mount an ATS-3 board and the new board in a single enclosure and have a very nice, small table top rig !

436. Direct frequency entry ATS 3

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-10-27 01:26:37 UTC
From: Bert Morton
Topic: 436 Message: 436

I have noticed that when using direct frequency entry with my ATS3 it comes out a tad high. As an example when I enter 3566 I end up being on 3566.3. When I power up the default frequency is right on at 3560.

Is this normal ?

72,

Bert W1DFU

Bert,

If you have one of the first batches of ATS-3's, DFE mode added (or subtracted) 50 Hz steps to get to the new frequency. Unfortunetly, the 50 Hz step isn't quite exactly 50 Hz, and when added together a fairly large number of times, the fractional error becomes noticable.

This problem was solved by calculating the proper DDS phase word each time the frequency is changed, rather than adding frequency steps to a base frequency word.

If you like, you can send the rig to me for firmware upgrade, which will fix that problem and a few other minor bugs you might not have noticed, plus add new features like the XIT tuning and three keyer memories.

That crossed my mind, but there would be some tricky mechanical issues
doing that. I wish they still made those little 1/4" led displays they used
to use in early calculators!

It looks like the BUD "converta boxes" will do the trick. The smallest is
3" X 4" X 1.5", about the same size as the BLT case, but an inch longer or
wider, depending on how you look at it. And I could really use that extra
inch. They also come in larger sizes, if someone wanted to put more stuff
into the same box.

Hi Steve,

You recently had this particular rig in for service. It's the rig I bought from Monty N5ESE.

It's not a troublesome situation by any means at the moment, but I'll send it over at some point for you to look at.

I'm the guy that came over to the picnic table at hosstraders to thank you personally for squaring the rig away after I got it from Monty.

72,

Bert

Yeah, but I belive thier in a .5" high and .4" wide package. No space
savings there. I'd like to find the kind where four digits fit into a 14
pin DIP socket and have the maginfying lens on them.

I remember those. Come to think of it, it has been a long time
since I've seen a small segmented LED display.

443. ATS-3A springs to life

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-10-30 20:37:45 UTC
From: Thomas Kuehl
Topic: 443 Message: 443

Hi group,

About 1 1/2 weeks ago I received my ATS-3A kit from Steve. Having but an hour so a day available to work on the kit, I finished the board assembly this past Saturday evening. I had enough time to start going through the check-out and calibration that night. Much to my surprise and joy everything went perfectly.

Yesterday, I started drilling on the Altoids tin that I had sprayed with a few coats of light gray paint during the evenings of the prior week. I didn't get started with the drilling until about 2:30PM. Although most of the drilling went pretty well, figuring out how to fit a female BNC on the tin proved to be a time consuming task. But now the ATS-3A has a nice BNC connector in place.

Then last evening, about 6:30 PM I connected an antenna and on 40 meters heard the first signals. Switching to the dummy load and pressing the key produced RF output. After a bit of receiver tweaking I put it on the air and called CQ. K7NM, near SLC came back. We had a great path and he told me at times I was 589. Certainly his 40-10 meter log periodic didn't hinder my signal.

This morning, I hooked the ATS-3A up to some equipment here in my lab at work. Although I have the exact numbers, the approximate output power is 1 to 1.2W at 6V, 2.3 to 2.8W at 9V, and 4.0 to 4.7W with 12V. That of course depends on the band. Interestingly, with my 12.2V switching supply the power is between 4.5 and 5.0W, on the lower 3 bands. Point 2 volts makes a big difference, but I have to watch the supply voltage doesn't get too high.

I must say that building the ATS-3A is quite challenging and required more mental involvement than building my K1 or K2. Don't get me wrong, I really like my Elecrafts. It is just building this radio seemed like a lot more work!

The ATS-3A will be part of my set up while I am operating from Germany from November 13th through the 17th. Maybe my little signal will make it back across the pond.

I agree Thomas. I just started on miy kit over the weekend, and I am jsut
about finished with the main board. Of course, I don't know if it works, but it
has been a different experience than building the K-2/100 and the KX-1. I am
really enjoying it but am missing R-1 and a capacitor for the 40 meter board.
My SMD experience is minimal, but it is a challenge and a lot of fun. Steven
deserves a medal for all his work in this regard....73, Ci

You both are to be given a real thrill when you discover the little
radio receives so WELL. I know I was just amazed when I listened to
first my FT-817 and then the ats-3 and not often but EVERY time the
signal on the ats-3 was louder and more clear. The Signal + Noise/Noise
ratio was much better on the ats-3. Thomas be sure to test your ats3a
over in Germany on 40 meters where the loud broadcast stations are. My
ast-3 has serious problems with them as does the 2n2-40 receiver.

Thomas your going to have a lot of fun over there. I wish I could
get my 85 feet of wire and a T1 tuner to you. I use this antenna end fed
at my daughters hospital and get out real well. But she is at 9700 feet
so that helps more perhaps :-)

Hi Karl,

The ATS-3A has the 2-section front-end filter on 40 and 30 meters. I used even lighter coupling between sections on my 40 meter filter to increase the filter Q (1pF in place of the 2.2pF coupling cap). This morning I was listening on 40 meters and thought I might be hearing some SWL related overload, but because of the narrow filter I am not sure what it was.

I am not accustomed to using a receiver with a narrow IF filter. Normally, I use the widest filter that the conditions permit. So the band seems quiet (dead) until I come across a strong station. Sometimes these stations are so strong I use the volume control in my headphones to reduce the level. It seems like I don't I don't hear many weak signals. That may just be an aberration associated with having an IF bandwidth of a few hundred Hertz.

When I get back from this long trip, I'll compare the ATS-3A to my K1, which has a similar receiver design. It will be an interesting comparison.

I'm not positive, but I've been hearing stuff on 40 meters at night around 3 am to dawn here in California. I'm thinking it's over the horizon radar. Yep, on 40 meters. It's not all Ghz stuff. It's all over the cw portion. We also get a lot of JA's ssb too, all over the 40 meter band from 7.035 on up to 7.100. Always loud in Ca.

450. Aluminum ("aluminium" for you G-landers) enclosure for Sprint - anyone have one?

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-10-31 20:53:37 UTC

Has anyone installed their ATS in this housing:

http://www.americanmorse.com/aa1.htm

If so, I'd be interested to hear how you like it and how convenient it
is (or isn't) to open it to change band modules.

Thanks,

John AE5X

I have been looking at those boxes too and may get a
couple to try out. Looks like you might have to move
the buttons to the other side of the board and open
the box from the top. I don't like protruding screws
on the bottom of my rigs. :)

Also, it looks like the boxes are not finished. I was
hoping for some kind of anodizing but that would
undoubtably cost even more.

Anyone tried one yet?

I just finished my ATS-3A and had a QSO with AC2C in Maryland (not bad from Montana)on 20 Meters. At first I had a "Whoop" when keying the transmitter, but was able to adjust it out using the on-board cap. Now I find my 40 meter board has the same whoop so I will continue troubleshooting that filter. Any suggestions would be appreciated. What a neat little radio this is...Ci

Subject: [AT_Sprint] ATS 3A First QSO

I just finished my ATS-3A and had a QSO with AC2C in Maryland (not bad from Montana)on 20 Meters. At first I had a "Whoop" when keying the transmitter, but was able to adjust it out using the on-board cap. Now I find my 40 meter board has the same whoop so I will continue troubleshooting that filter. Any suggestions would be appreciated. What a neat little radio this is...Ci

Nice job Ci,

If it is from the first 3A batch make sure that you
have a larger cap in place for C54. (Search the
message on the group for a discussion on that).

Also, make sure that you have a stout power supply. I
see similiar results when using a battery that just
does not have much juice left. Will work fine for rx
but when you go to tx it just can't handle it. 8xAA
works FB in most cases. Those 9v rectangular batteries
are only good when fresh and even then they don't last
long.

Aren't there issues with too much voltage? I know some AAs are high
fresh out of the box.

first 3A batch

Thanks for your advice, Mike. Mine is from the most recent shipment, so I
shouldn't have the cap problem. Thanks for the advice re the battery, as well.
That was the problem! I assumed since the various parts can run on much lower
voltage that my well-used NIMH 9 volt was good to use--it isn't. Again,
thanks...73, Ci

I am using 10 by rechargeable AA in a 10 pack I ordered from Mouser.
The rechargables are about 1.2 volts most of their life. They seem to be
good for a whole day of portable use.

Ok, he was loud, about a S-6 on the imaginary scale. But he was not getting much action on 30 meters calling CQ over and over. The band was very quiet. I couldn't hear anybody else but xf4dl. So I threw out my call: n5vwn/qrp. He came back straight away! "n5v?" So I sent it off a few more times and he was patient and got it! Helps make up some for not getting Peter-One island even with 100 watts. Although I heard of another guy that worked Peter 1 with a kx-1. So I went to bed at 2am and couldn't get to sleep for an hour basking in the thrill. I would have stayed up longer too, but the XYL had enough of that! hi hi

"You can overcome a bad rig with a good antenna.
But you can't overcome a bad antenna with a good rig."
Okay...not an absolute statement. hi hi The kx1 is a good rig but a great antenna helps! At the time of Peter 1 my only 100 watt rig was an aging DX70 and my antenna is rather low to the ground at about 20'. And the Pile ups were more than I had time for. Full time job to snagg them and I didn't have the time.

On another note: the Alinco is now in the Philippines awaiting my time there over Chrismas. Hope to work you guys. I'll be DU9/N5VWN. Tempted to take the ATS3. Japan is very loud on 40 meters in California and even on 80 so I'm hoping the Philippines will be loud also. I don't hear them much though.

It's not lack of voltage, its the lack of current
capacity.

Steve explained it once, something to the effect, that
these 9V batteries are just a bunch of really small
capacity cells in series. As such, they have high
internal resistance and thus can't supply the peak
current needed for tx.

Yup, if you take apart a regular alkaline 9v battery you will find
several quad A (AAAA) batteries. If you have one of those small LED
pens it is a good source for your batteries.

Lithiums are the lightest. There are two common
varieties used with these rigs.

1. Lithium (non rechargable) AA sized (Energizers I
think). Use 6 of them for about 9.0 volts.
Here is a link to the manufacturer <
http://www.energizer.com/products/lithium/default.aspx
>

2. Lithium-polymers aka lipo's. These are 3.7 volts
per cell, so a 2-cell version is 7.4v while a 3 cell
version is 11.1v. Theses come in different current
capacities. For the Spartan Sprints I use 2-cell
240mAh sized lipo's. These are the super lightweight
BUT require careful handling and charging.

Hey gang;

Well it is a little of both actually. Low voltage does not help any, but you are right Mike that the inability to supply current rapidly is a problem to the tx "power chain".

In fact when you take apart a standard 9v cell you will find not just one cell but 6 in series. And they are too small to supply much current for any length of time. O.K. when they are absolutely fresh, but that is not for very long either. If in doubt, just think how much current you can source quickly (after all this IS suppose to be a class D/E final structure) from a AAA cell. Then compare that to the size of the 6 cells in the 9v case.

So everyone is right here, just depends on what you performance expectations you are willing to settle for.

Hi group,

We'll I am now in Bangalore, India. My ATS-3A, ZM-2 and various wires packed inside my luggage made it through the US inspection without a hitch. Normally, upon arrival at my destination I find one of those TSA cards stating my luggage had been searched. Not this time. So after this very busy work week coming up, I'll head back to Germany where I'll put the ATS-3A on the air. Maybe I'll be lucky and work some DX from the US!

Thomas,

Since more than a year I am taking my ATS-3 with the elecraft T1 ATU with me on business trips (which are more or less each week). Sofar I never had any problem with the airport security.

I am also taking a small telescopic fishing rod (1,5 meters stretched out, 40 cm collapsed) to gain some clearance from the wall when I am throwing out an 8 mtrs long wire in an inverted L fashion.

With this setup I have many times made 1000 miles per watt, like 4X/DF6MU to P43, TA1/DF6MU to 9M6, ZS6/DF6MU to UA9 (just two weeks ago). Mostly on 40 meters using greyline skip, always from hotel rooms.

I wonder if anybody has an experience with small loops indoors (some hotels don't have windows)?

>I wonder if anybody has an experience with small loops indoors (some
>hotels don't have windows)?

Sergej,

Small loops are very sensitive to near-by objects and in a typical motel or hotel room, there are pleanty of those! And if the building is made of steel and concrete, not much signal is likely to get outside.

I played around with a small "distributed capacitance twisted loop" for 40M made from twin lead while I was living in a small, one room apartment. (Okay, it was really a hotel room). Tuning was very touchy and never did get it right. Of course, I didn't have a very good way of keeping its shape or a good way to hang it, which was probably much of the problem with it.

I trust you've tried just running your wire around the room without much luck? How about zig-zagging the wire up and down in front of the window? Or maybe up and down in front of the outside wall.

If anyone wants to try the DCTL, a loop is made from 15 feet, 7 1/2 inches of 300 ohm twin lead with a half twist in it. Hang it as an equilateral triangle. It is feed from the bottom with 300 ohm line. A 2" open and 27 1/2" shorted stub is also connected to the feed point.

On 15:46 UCT a new ATS 3a arrived alive and well with a QSO for the first time with PJ4/DL1CW on 20 Meters....WOW!!! He sent me a 539. The bands are pretty bad out there and he wasn't giving a ton of 5nn's out even to the QRO stations so I"m VERY happy!!
This is the third ATS I've built and I have to say this is the Ferrari Testarossa edition of the ATS 3, very sleek and with enhancements!!!! VERY COOL!!! Since I had an ATS-3 running I wasn't in a hurry to build the 3a but I have to say, I should have built it sooner. My KX1 will be collecting dust...I think I'll have to take the batteries out of it and put it away.
I was messing around this morning and had two antennas connnected...one to my FT-1000D and one to my ATS-3a...I have to say the receive on the ATS 3a is pretty hot stuff...wondering if anyone has done a side by side comparison and what they came up with.
I am SO addicted to these GREAT little rigs...they are a BLAST to build and even MORE fun to put on the air. I wish I had a strong back ground in electronics so I could FULLY appreciate Steve's incredible design I HAVE to say that every time I build another one I do learn a little more but I have decades of catching up to do!!!
I can't believe the genius of KD1JV....this rig even packages up smaller than the 3!!!!!
OK Neil if you are reading this how are you doing with your kit ;) ;) ;) ???

Okay, I read all of the posts.
The short answer is bad, I cleaned all my soldering stuff and
magnifying glasses off of the kitchen table to impress my girlfriend
this weekend, and I had just started it.
Well, that didn't work, it apparently takes more than a clean table to
impress a woman, I wish you had warned me!!

Long answer, soon. I'm hoping to get the main board finished this
weekend. Let her be unimpressed, what the heck.

Ann,

Congratulations on your ATS-3A's successful build and first QSO. Mine is with me here in India, tucked away in my carry-on baggage. So far, my ATS-3A, tuner, paddle, twin lead and antenna wires have made it through each of the airline inspections without concern. Yesterday, my travel partner had his bags repeatedly searched because of the electronics demo circuits he had in his bags. Fortunately, he was able to explain what and why he had all of it in his luggage. Since I don't have an Indian operating license and I am not operating my gear from here, I don't want to have to explain to the Indian author ties why I am carrying amateur radio equipment in their country. They are very nice people, but also very tenacious when it comes to their security.

Next Monday morning, just after midnight, I head back to Germany. If all goes right I should have my ATS-3A on the air by Monday afternoon from DL-land. No problem there because of our CEPT agreement.

Again, congrats on your accomplishment.

'73, Thomas - AC7A (Pune, India)

Ann <AB1DR@...> wrote:
On 15:46 UCT a new ATS 3a arrived alive and well with a QSO for the
first time with PJ4/DL1CW on 20 Meters....WOW!!! He sent me a 539.
The bands are pretty bad out there and he wasn't giving a ton of 5nn's
out even to the QRO stations so I"m VERY happy!!
This is the third ATS I've built and I have to say this is the
Ferrari Testarossa edition of the ATS 3, very sleek and with
enhancements!!!! VERY COOL!!! Since I had an ATS-3 running I wasn't
in a hurry to build the 3a but I have to say, I should have built it
sooner. My KX1 will be collecting dust...I think I'll have to take
the batteries out of it and put it away.
I was messing around this morning and had two antennas
connnected...one to my FT-1000D and one to my ATS-3a...I have to say
the receive on the ATS 3a is pretty hot stuff...wondering if anyone
has done a side by side comparison and what they came up with.
I am SO addicted to these GREAT little rigs...they are a BLAST to
build and even MORE fun to put on the air. I wish I had a strong back
ground in electronics so I could FULLY appreciate Steve's incredible
design I HAVE to say that every time I build another one I do learn a
little more but I have decades of catching up to do!!!
I can't believe the genius of KD1JV....this rig even packages up
smaller than the 3!!!!!
OK Neil if you are reading this how are you doing with your kit ;)
;) ;) ???

I've done a sid-by-side with my ATS-3A and an FT-757GXII and the sensitivity is virtually identical. However, I much prefer the narrower filter in the ATS-3A.

481. ATS-3A keying thump revisited

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-11-10 00:37:30 UTC
From: Dave
Topic: 481 Message: 481

I made a serendipitous discovery today. I noticed the processor wasn't resetting normally in K2OQ's newly completed ATS-3A, so I pulled out the board to fix an unsoldered pad on the twisted U12 reset chip. I also swapped out the 22uF cap for a 100uF. At the same time, I noticed that L3 had been wound with 14 turns instead of 13, so I corrected that as well. When I was done, I found that the key-release thump was much more pronounced; a real thump instead of just a click. Tacking the 22uF cap back in on top of the regulator chip, in parallel with the 100uF changed nothing. The thump is now as heavy as it was on my ATS-3A before doing the Mute-line resistor and capacitor.

I figure that the reset-chip fix is totally unrelated, so my conclusion is that changing the number of turns on L3 made the difference. I don't know what to make of that, though. I know I'm counting the turns correctly (1 pass through the center = 1 turn); my counts on the band-module coils match the pictures in the manual.

Any thoughts? Aside form the thump, what's the effect of using 14 turns on L3 instead of 13 turns (increasing the inductance by 16%)? Measured power output is the same with either 13 or 14 turns.

Dave

Never mind. I tried reversing the changes I had made (except for that which fixed the reset circuit) and the click/thump remains about the same. In this case, the 100uF cap doesn't seem to do any better than the 22uF either. It appears that this ATS-3A will need the resistor and cap on the Mute line, as did mine.

487. Programming memory keyer

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-11-19 04:55:37 UTC
From: Karl Luedemann
Topic: 487 Message: 487

I have been having trouble with programming more than
1 memory location in the memory keyer. The manual
says to send 7 dashes to separate messages, then right
below it, it says, "If more than one message was
entered, you will hear the 8 dash break separating the
messages". My first message goes into the keyer, but
I can't get the other two to send the, RIT button, as
the manual says which is "SPLIT" now, and the tune
up/down buttons. The SPLIT button sends my first
message, but the tune up/down buttons don't send the
other two. I think I am doing something wrong? 7 or
8 dashes between messages doesn't seem to work.
What's going on? Thanks for any help!

I do not know if this will help but i found the timing to be cridical when changing the keyer speed. I had to hit the up or down key almost instantly to change the speed. if i didn't the sprint would not go into the menu option. Once you have the hang of this it is very good because operating the sprint is very fast. I would try entering mesages on mine but i do not have a paddle. I hope this will help.

Guys, I think there is some problems here. Changing speed with a straight key is next to impossible. Then making a memory or memories is total impossible. You need a keyer paddle of some sort.

There are four buttons on the radio. Many functions are press RIT and let up on the function you want. The problem with more than one message saved is hard because there are times you tap a function and times you hold down a function.

When I compare entering and correcting saved CW messages, my FT-857D is a snap and my ATS-3 is a chore. But both radios assume you have a paddle.

Couple of thinks,

make sure that the memory marker is 7 dashes in 1
character. That is, hold the dah paddle down for 7
continous dashes. If the manual says 8 then Steve
might have made a mistake on that.

the other thing is that to get the second two memories
to play you should be fairly quick on the second
button (tune up or tune down) after clicking the rit
button.

If you hear your first message then the memory marker
was input correctly because the firmware stops the
first message when it finds a memory marker. So I
think it may be the starting of the 2nd and 3rd
memories that might be the problem. Try two fingers,
one on the rit button and one on the tune down button
(for the 2nd memory) and experiment with timing till
it works.

Let us know how it works out...

I think you are getting us mixed up. Kar is the one with the keyer memory issues, I just noted that timing seemed to be cridical when operating the ats3a. I only us a strait key and i did not have much trouble changing the keyer speed with the buttons on the ats3a. I just changed it so the freq counter and anouncements would be a little easier to catch. I do not plan to use the memory or a paddle at least in the neer future. I find the ats3a very easy to operate after i spent a little time geting used to it.

Thanks to Michael, W1MT, I read the manual again and it made perfect sense. It works fine. The second memory has to be sent with a two button sequence, first the RIT, or SPLIT button, followed quickly, (within 1/3 of a second), by the Tune down button, (or Tune up button, depending on what memory you want to send. I was just quickly hitting the tune down button alone, as sending the first memory is a one key sequence of quickly hitting the RIT button. I had tried that, and simultaneously hitting the RIT and tune down buttons quickly, neither of which worked. Thanks Michael!--- In AT_Sprint@yahoogroups.com, Michael Harnage <w1mt@...> wrote:

494. 40m LC Filter from my photo gallery now tested

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-11-20 09:42:58 UTC
From: Lutz Bergner
Topic: 494 Message: 494

Hi all,

For some time I have schematics of my new sharp RX filters in my photo gallery. The 40m one was the only one not beeing tested before- only simulated.
Last weekend I built up one and compared it side by side to the ceramic filter BM (Murata SFE7.02). The results did surprise me a bit. I does sound as good as the simulation looks alike.(450KHz BW -20dB). The far-off selection of the LC filter seemed to be considerably better. I tested both filters in the worst time here , in the early evening hours. While there were some weak BC carriers and weak modulation artefacts audible with the ceramic filter - nothing of these with the LC!.
Antenna was a doublet with top 13m up. If there is somebody outside still trying to get the SFE7.02 for this purpose - there is no need to anymore. From now on I do prefer the LC one in my ATS-3.
Winding of the T37-6 toroids with 25 turns of the relatively stiff and thick 0.3mm magnetwire was not easy though. I broke 2 cores while trying it because 25 turns just fit on the inside of a T37 core. Unfortunately I can't suply measurement results. (not yet)

Hi Steve,

can You share which status is currently with the base station accessories kit for ATS-3A please as I am very interested in and You can be sure that it seems to be my xmas gift...

Which casing You decided to use finally please? Is the PCB same size as ATS? It should be great to be able to stacking with current ATS pcb. Bad idea?

What about the mini autotuner builded in he accessory kit? If is already builded SWR meter??? Should be last one which highly missing for backpacking and its finaly best rig for me at all...

I'm still waiting for the circuit boards and a couple of parts to arrive. I know the parts are in transit and hope the boards are too.

>Which casing You decided to use finally please? Is the PCB same size
>as ATS? It should be great to be able to stacking with current ATS

The assembled unit is 2.5" wide, 3.5" long and 1.5" tall. (6.35 cm X 8.89 cm X 3.81 cm) So, its a little too big to fit into an Altoids tin. Even if I had used all SMT parts, or more than I did, I don't think I could have fit it into an Altoids tin anyway. And since this is a base station accessory, saw no need to try.

>What about the mini autotuner builded in he accessory kit?

I don't think I could do an autotuner any smaller or less expensive than the Elecraft T1. For camping, I'd much rather a simple L tuner for 1/2 wave wire. Its simpler, smaller, lighter, more reliable and doesn't need power.

I can vouch for the T1. Its a really nice little autotuner. But, the ALT (Steve's design) also works very well with a 51 foot wire and counterpoise/ground radials and it does fit into an altoids tin and requires no power.

There is a commercial version of this kit available from Hendricks QRP kits (http://www.qrpkits.com/altoidslongwire.html). Its a fun little kit to build and works surprising well. I have found that once you figure out the jumper settings for a given band / wire length, the jumper settings are pretty much static so all you need to do is preset them and tweak the cap until the LED dims. What I also like about the ALT design is that the rig sees a 50 Ohm load during antenna tuning so no fear of your PA transistor "going south" while you try to figure out the matching.

Michael VE3WMB

P.S. Usual disclaimer: I have no financial interest in Hendricks QRP kits, I'm just a satisfied customer.

Ditto on the ALT Tuner and a BIG Two Thumbs up....it's easy to use and it's very lightweight. A LOT lighter than the T1.
I know the manual suggests 51' with a 16' counterpoise but I use 66' with 16'. I KNOW it's supposed to tune on 40 though 10 but with 66' I have been able to tune on 80 using a NVIS antenna for "local contacts"...am I putting my ATS-3/ATS-3a at risk or are these results a fluke????

I like the idea of the ALT tuner. My T-1 is fine except for 80 meters. It get's real fussy about tuning that unless I'm about 1/4 wave length of wire. I've been using my mini travel tuner most of the time. I've also got a BLT and it's not the greatest either. Really finicky about wire lengths. Gosh, that T-1 cost a fortune too. Works pretty good with mobile whips and close to resonate dipoles and beams. My big thing is having a compact tuner and being able to tune 20-80 meters but not being too big of a package.
Keep in mind that I built these tuners and my success record isn't perfect. But the K-2 has been working great! Also, on a side note, I notice that after I put my ATS to sending messages in slow code. I can't go back to fast code again. It just says "s" There is no fast option. I might have to figure out how to reprogam someday. Other wise the ATS3a has been working fine. Oh, is there suppose to be a "wide" option for the filter? I don't seem to have that. Or was that for the 1st run of the ATS3 only?

I can vouch for the T1. Its a really nice little autotuner. But, the ALT (Steve's design) also works very well with a 51 foot wire and counterpoise/ground radials and it does fit into an altoids tin and requires no power.

There is a commercial version of this kit available from Hendricks QRP kits (http://www.qrpkits.com/altoidslongwire.html). Its a fun little kit to build and works surprising well. I have found that once you figure out the jumper settings for a given band / wire length, the jumper settings are pretty much static so all you need to do is preset them and tweak the cap until the LED dims. What I also like about the ALT design is that the rig sees a 50 Ohm load during antenna tuning so no fear of your PA transistor "going south" while you try to figure out the matching.

I don't remember off the top of my head as I don't use
Steve's code anymore but if using the same button that
got you to "S" doesn't toggle back then it's probably
another button that puts you into "F" mode. I'll check
on Monday.

>Oh, is there suppose
> to be a "wide" option for the filter? I don't seem
> to have that. Or was that for the 1st run of the
> ATS3 only?

Wide mode is available for the ATS3 only, not the
ATS3A or ATS2. Limited of the hardware.

There is no fast/slow option, you can set it to any speed you want to.

"S", the first selection in the menu is used to set the code speed of the keyer. Once you select a perticular keyer speed, you can store that to be used as the speed at which the frequency ennunciation is sent at, by going to the "P" option in the menu.

This of course, is all explained in the manual. Though there might be a mistake about which button to push to store that code speed. If it doesn't store the new speed, try the other button.

Oh hi Steve, I don't have a problem with the code speed for sending. I'm talking about the code speed in which you receive information. I'm down there on the menu where it says toggle down for Iambic b or a and toggle up for sending fast or slow for stuff like reading frequency. But it only gives me the slow option not the fast. I had been using the slow readback code speed. Now I'd like to go back to factory default fast speed. Hope that clears it up.

503. Just Finished My ATS-3A Last Night - Great DX!

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-11-27 02:10:18 UTC
From: Andrew C. MacAllister
Topic: 503 Message: 503

I only had one wiring problem - U12 was not soldered well. After hunting for a few hours, I found it, and the rig came right up! I did some calibrations, and put it on the air - right in the middle of a DX contest. Why not?!? Using a 9V battery with ~3W out on 40M to a vertical (18AVT) in the back yard, my first-ever QSO with the ATS-3A was IR4M. A few other European and South Pacific stations were just not hearing me well, but further QSOs with VY2TT and VP5SW were a LOT of fun!!

Thanks Steve!!!

Two photos have been posted. Now to box it up...

Steve, Any chance of pushing ATS to 17m? I know this is the upper limit or maybe over the limit for the CPU but 17m is such a cool band. Just wondering? I've a 80m that's still not loaded and was wondering if there was hope of 17m? or space for the code even?

Hi Steve,

At the moment I am working on it. I even intend to push it up to 15m. Just purchased a new 60MHz crystal oszillator and a 75MHz version of the AD9834. Steven suspected that even the BRU version might cope with 60Mhz clock. When I studied Stevens program source I found commented out code to extend the ATS-3 to 160,17 and 15m. Obviously the CO has to be taken up in frequency to meet Mr. Nyquist but with 50MHz you should reach at least 17m. I already designed a new spurfilter for the AD9834.Now I am still waiting for some AMIDON cores to come and will do this major mod at one of the next weekends. Lets keep fingers crossed that all goes well. removing the tiny DDS will be not too easy. Will share all results when I have proved ones AND can recommend the mod ;-).

One could do it. Because of the way the bands are
"sensed" you are limited to 4 bands to be autosensed
so you would have to do 40/30/20/17 or similiar. For
this reason it would not really affect code space,
just change one of the current bands....

The problem with this, is not the CPU but the clock
driving the DDS. It is pushing it to do 20M on the
ATS3 with the 40MHz clock. It would be pushing it even
farther to try 17M on the ATS3A with a 50MHz dds
clock.

For this reason I would not recommend it.

509. Waterproof, uncrushable case for AT Sprint

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-11-27 19:01:42 UTC
From: kb2tqx
Topic: 509 Message: 509

I was doing some measuring up in preparation for receipt of my forthcoming AT Sprint III, and found out that a polycarbonate, watertight case I had on hand is a perfect fit for an Altoids can.

The box is viewable here:
http://www.otterbox.com/products/otterbox/1000/index.htm

When placed in the Otter Box 1000 an Altoids can has approx 3/8" clearance on top and 3/8" length ways, so there should be room for the AT Sprint III RCA connector sticking out the side.

The Otter Box 1000, with lanyard attached, weighs in at 5.2 ounces, so you might not want to count that as part of your uberlight station, but it's nice to have an uncrushable, watertight container for your AT Sprint when you are out on those rigorous hikes.

Usual statement. No affiliation or financial interest in Otter Box, I just think they are "way cool" containers.

I use an Otter Box 2000 to hold my Yaesu VR-500 miniature communications receiver. There's room in there also for a small BNC telecopic antenna, spare batteries and 30 feet or so of some small gage insulated wire for a long-wire antenna.

So True! It won't be the ultimate in weight loss, but YES I am working toward a Very Light-Weight, but highly functional, contender for the Spartan Sprints. I must have a paddle, and not just tap on the rig's buttons. I had a nice design in my ATS-3, but it is made of Stainless Steel relay parts. This one will once again be built in, but will have lighter components. I would like to go with a single earbud, but I MUCH prefer one for each ear. I will also be operating with less power. That may be a problem, but I will only go up to 3 Li-Ion batts if I must. For now, I will try 2 batteries for 7.4 VDC.
:-)

Hi Lutz,

I was wondering if you had checked out the frequency limitations of the 74HC02 and 2n7000s in the transmitter? Also, what effect will higher frequencies have on the power handling capability of the 2n7000s? I think the 74HC02 will be fine at the higher freqs, but am not sure how close Steve designed the power handling of the FETs. Have seen several cases where the FETs seemed to blow easily and wonder if the higher freqs might make them more fragile.

Circuit boards and all parts are now in hand. Just need to finish the instruction manual and start bagging parts.

So, you all can start ordering them now. Please refrain from using paypal if you can. I'll put a picture of the unit up on my web site in the next day or two.

ATS Base Station Accessory:

Four digit LED display
Frequency counter for direct reading dial on all bands.
0-9.99 watt RF power meter. Forward and Reverse power readings (Not SWR)
2 Watt audio amp for driving a speaker
6 to 11 volt variable regulator for variable power output.

$45.00 postpaid in USA and Canada
$3.00 DX airmail postage

Interesting, wonder if they found it would run faster or changed the fab process? Expect a significant increase in current though. In addition to changing the reference clock and output filter, the 74HC02 will have to be changed to a 74AC02, as the HC02 falls short driving the 2N7000's above 14 MHz.

Hi Mike,

I will follow Steve's hint and replace the HC02 with AC02. That will be crucial regarding the life of the 2N7000s too. The question is if they can pass their linear operating range fast enough to survive due to the increasing influence of the capacities. Anyway by replacing the AD and the HC02 nothing is lost. If all fails I 'll be happy with 17m added. I think , testing the PA on a piece of PCB will be a good idea. Then I will know how far we can go.

Does anyone know what voltage a LiPo battery runs? I can purchase a Lithium Polymer battery and charger from the company I work for at a good price. Each "9V" battery is rated at 500MaH, and of course would fit inside the radio housing! I was wondering if they hold their voltage until fully discharged as well? I will try to ask one of our engineers at work if I can't find an answer.--- In AT_Sprint@yahoogroups.com, Mark Brueggemann <qrq_cw@...> wrote:

I have been dealing with http://www.batteriesamerica.com
<http://www.batteriesamerica.com/> for MANY years. My ATS-3 has three
300 mAh Platinum Polymer batteries running 3.7VDC each. These are
excellent batteries. I am going to try using two 200 mAh batteries in my
ATS-3A. The lower capacity batteries do not handle heavy current loads,
but I am going for less weight. The voltage holds up well until the
batteries are nearly depleted, BUT they should NEVER be depleted below
the specs that come with the battery. Use only Li-Po chargers.
Protection circuits are available to prevent overcharging and
low-voltage depletion. I did have one of my 300 mAh batteries go too low
once. It puffed up and had to be removed and thrown out ASAP. I had the
batteries epoxied in the top of the Altoids box. It was an opportunity
to go from Wintergreen to Ginger :-).

My ATS-3A is shaping up well, but won't be the world's lightest rig. I
will post some photos when it is complete.

From: kb2tqx
Topic: 525 Message: 525

Take a look at these battery fuel gauge PCBs at BatterySpace.com:

https://www.batteryspace.com/index.asp?PageAction=VIEWPROD&ProdID=2775

They are designed to plug into a multi-cell LiPo pack protection PCB, but from the specs it looks as if they could just be placed in any circuit that is fed by aLiPo pack, across the voltage supply.

Does anyone have any experience with these little guys. It looks like a super lightweight PCB and could be made to fit nicely into an AT Sprint.. At $3.95 + shipping each they might be some cheap insurance against accidentally over-discharging your LiPo pack. To get around the relatively large shipping cost from BatterySpace for a single item, this might make a nice group buy item for AT Sprint owners. The PCB is so small and light I'm sure could be forwarded for a couple of 1st Class stamps in a little padded mailer.

I am just now putting together a personal order to BatterySpace, anyone interested?

Only in my head. :)

How bout a daughter board the same size as the main board that plugs into the main board. On this daughterboard would be filters for 8 bands (assuming that you have already upgraded your dds, oscillator and NOR gate. Also on this board would be another MPU that talked to the MPU on the main board serially thru the two ports currently used to sense the band module. The daughtercard MPU would switch relays and analog switches to select the correct filters for current band in use. Of course the firmware will have to change and new firmware written for the daughterboard. Not sure if everything would fit on the daughter board--that would be a lot of roids and such to populate along with relays. Perhaps some ecominization could occur?

These are ideas that have been percolating in my head for a long time. Actually, originally was only thinking of a 4 band board but with the recent realization that the 9834 has been upgraded why not dream big? Only band not included would be 10M (and of course 60M).

Not sure I could pull this off all on my own and don't think there would be a large market but darn wouldn't it be slick!

Just a thinkin out loud,

----- Original Message -----

Circuit boards and all parts are now in hand. Just need to finish the instruction manual and start bagging parts.

So, you all can start ordering them now. Please refrain from using paypal if you can. I'll put a picture of the unit up on my web site in the next day or two.

ATS Base Station Accessory:

Four digit LED display
Frequency counter for direct reading dial on all bands.
0-9.99 watt RF power meter. Forward and Reverse power readings (Not SWR)
2 Watt audio amp for driving a speaker
6 to 11 volt variable regulator for variable power output.

$45.00 postpaid in USA and Canada
$3.00 DX airmail postage

Just the relays alone would take up more space than the main board! Then
you have to add all the filters, both input and output. Plus it really
takes 16 relays, not 8, since I have not found a good way to electronically
switch the input filters yet. The other problem is the PA doesn't seem to
like long connections going to the filters. Belive me, I've looked into
this and it turned into way too big a can of worms.

Hey Gang;

Actually, I would imagine that filters for 17/15 could be combined, and thereby lower the number of networks required.

Also, and this is just my opinion, but field packable antennas for 160 are a real problem to make work well and still be a "hike in" item; so not including 160 into the mix also seems logical to me. This would further lower the number of networks required.

I had to file one corner off of the board, but that could be because of my sloppy drilling of holes. The four buttons are on what would be considered the bottom of the case (just as with the altoid can)., and the top (which becomes the bottom while operating) easily opens by loosening the two screws and sliding the panel to one side to change band filters. It is on this top (now bottom) that the feet are mounted and must exceed the height of the two screws holding the plate in place. I don't have pictures, but it looks so much like the altoid enclosure that they would make little difference. I am very please with the case although it would have been much nicer had it been pre-drilled.

I thought so too, but turns out if the filters are not optimized for each
band, effiecentcy and power output suffers to an unacceptable degree.

My ATS IIIA kit arrived in yesterday's US Mail. Thank you Steve for your prompt handling of the order. Much appreciated.

This is going to be my first major SMT kit build, so I am going to take my time - check twice solder once, for sure.

I am in the middle of fixing the HV supply on my Tek 465M scope, so I am going to complete that first. Then "clear the decks" and set up a clean "walled" work space. Install my never-been-used, super-fine pointy tip in my OK Industries solder iron, turn on the bright desklamp, break out the magnifier headset and go to work.

I haven't been this excited over a kit in a while.

Thanks for all the encoragement guys!

I'll add the beeswax and toothpicks to my list. I have already printed out the whole manual, and even put it into page protectors (2 sheets in one sleeve, back to back) and put it in a nice skinny binder, so I can pick it up and read it whenever. I ALWAYS read through assembly manuals at least twice before building to get a sense of what I am going to be doing before I get in there and follow the detailed instructions step by step. I like to get an overview before I start, kinda build it in my head first.

Steve, you do a nice manual. It's got enough diagrams and pics so that you don't get too robotic about the steps of installation and go all goofy. Thanks for taking the time to do a good manual.

My output is over 3 watts on all bands exept 40m, 2 watts at about 9 volts supply. I have checked all values and recounted turns and moved them a little. anyone else seen this?

545. Re: [AT_Sprint] 40 meter output:

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-01 19:34:12 UTC
From: Michael Harnage
Topic: 544 Message: 545

That is not bad for 9V supply. I would check output at
12V and if close to 4.5W to 5W wouldn't worry about
it.

If you want to get picky:

One thing you can do is check at various frequencies
within the 40M band to find where the peak is. That
will tell you whether you need to add or subtract
turns from LF2.

Hi Chris

Change C2F to 820p or solder a 120p NPO chip in parallel the existing
680p. That helps a lot.

Good point - Find the peak if possible. I must have wound all of my coils just right. With the 9V battery, all bands provided slightly more than 3W.

Subject: Re: [AT_Sprint] 40 meter output:

That is not bad for 9V supply. I would check output at
12V and if close to 4.5W to 5W wouldn't worry about
it.

If you want to get picky:

One thing you can do is check at various frequencies
within the 40M band to find where the peak is. That
will tell you whether you need to add or subtract
turns from LF2.

Its not my invention, David W6EMD did a carefully optimizing of all LP Modules. The new value for C2F was his mod for 40m. I did it on both of my 40m modules and it made a great difference. You may find Davids file somewhere in this yahoo group.

WOW! Thanks for the tip David W6EMD, and Lutz,DL2HRP! Output went from 2.3 to 3.3 at 9.1V. I used 120 pf npo 50 volt surface mount cap between c2f pins on the back of the board. I also checked, befor the mod, the output at powerup freq. and 100 khz up and it was .3 watts higher. I also modled this filter, and mod, on elsie and looked ok. also thanks to everyone who had sugestions. this is the only blog i have been on and am very pleased with the group. Hope to be able to help yall in the future!

You need to add a jack to connect the DDS output to the frequency counter.
To use all the functions, you need to also connect the antenna, power and
headphone output to the BSA.

I could see making a stand out of wood or foam construction board which
would hold the BSA up at a slight angle behind the ATS rig, and also hold
the ATS in place.

557. Fairchild BS-170 MOSFET

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-06 16:43:43 UTC
From: kb2tqx
Topic: 557 Message: 557

This is one for the RF geniuses out there. Does this MOSFET characterize the same as a Fairchild 2N7000? The gate capacitances and on resistance look close.

It has an 500mA Src-Drn max continuous compared to 200mA for the 2N7000, so I was wondering if it would make a more rugged working replacement for the output stage of the AT Sprint IIIA. It has the same package type - TO-92. You can see the datasheets via Mouser's website:

http://www.mouser.com/search/Refine.aspx?Ne=1447464+254016&Ntt=*Fairchild*+*2N7000*&Ntx=mode%2bmatchall&Mkw=Fairchild+2N7000&N=1323038&Ntk=Mouser_Wildcards

It's just that after reading the ATS-3A manual three times through the part talking about the possibility of device damage on highly reactive antenna loads with high SWR sticks in my mind.

Dave,

It's usually voltage that kills these things instantly, and it looks like both devices (2N7000 and BS-170) are spec'd at 60V.

563. Interesting experiment

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-07 03:31:39 UTC
From: Steven Weber
Topic: 554 Message: 563

Recently, I found a 80 MHz 3.3V clock oscillator I had forgoten I had. Must have ordered it for something and never got around to that project. So, today I tried an experiment. I hooked it up to one of my few spare AD9834 chips from the most recent lot and fired it up. Amazingly, it has output! Kinda thought it would, as AD respce'd the part to work at 75 MHz and didn't change the part number. And if it could be pushed that high, why not a little higher? Anyway, apparently 75 MHz isn't a stock clock oscillator freq where 80 is.

Now to change the reference freq numbers in the MPU, design a new filter and see if it will work up to 10 M. With an 80 MHz clock, it should be just do-able.

But this rises the question of what to do with this new insight. An ATS-3B which covers 20-10M?

Oooh, sounds cool - 17/15/12/10m - now I am wondering if there is a way to stack and switch an ATS-3 so one could lie underneath the other and share the module connections. Dang, I may have to buy an ATS-3A now for just this purpose. Or perhaps Steve could make an ATS-3B kit with options for 80/40/30/20m or 17/15/12/10m and then we can stack them. Or a single board with dual oscillators, though that would require more software space. My brain is getting wet from all this stormin'

RS components has them on stock here in Germany.(10,60EUR)
Thanks Steve for doing that experiment. This sounds most encouraging. My second major concern at the moment is , how far can we push this switched mode PA with given components without stopping it to be a switched one and thus producing heat - or at least considerably loose efficiency? Just ordered some 2N7000s and 74AC02 to check it out on a piece of PCB.
But before I can do that, I have to finish my multi purpose AD9951 based measuring equipment HFM9 (DL9AN/DK3WX) to be able to "see" what I am doing.
What I 'd like to say is - I probably can't supply results before first weeks in jan 2007. And I decided to wait with modding my ATS3 till I know what I can expect. ;-)

ATS-4. 9 bands! After all, its gonna require more
power why not go to a little larger board, put wide
mode back in, have rf attenuation vice agc and still
have changable filter boards. Size it to fit in a
standard smaller Hammond box. Oh and make digital
display optional and don't use the rocker switches,
keep with these tactile switches or go to a remote
flat tactile array, or even an ipod like interface. I
can really see the circle ring being very useful for
all kinds of radio control, etc.

My 2 cents.

Can you tell your operating frequency via audio on a KX1? Also, the
push button tuning would be nice for small frequency changes.

OK, I've thought about for a bit. All the ideas I am hearing are great.

BUT, primarily, I want a 17/15/12/10m backpacking rig similar to the ATS-3 or ATS-3A.

Secondarily, a nice small portable all band rig with modules would be great, too - something I can take to the field or use on my desktop.

ATS'ers,

Here's my dos centavos worth...

Move the band plug-in socket such that it protrudes throught the front panel, so that the modules can be inserted without having to open the can. I fumble around inside trying to get them in and out. I guess I have big hands.
The tactile switches are ok, but I'd like much bigger buttons on the switches.
The 8 band idea was one I was pondering last eveing while I was out on my run. We wouldn't be able to use the current modules because the pin decode would have to be 2-to the-3rd. But I like the idea of 80 through 10 meters in one little package.
Some kind of receive RF attenuator. Sometimes my ATS-3A blasts my ears off when I come across a super strong station. I like the variable pot option as oppossed to a fixed attenuator.
Add another pushbotton to increase the frequency tuning speed. Something on the order of 500Hz. I tend to scan the band from top to bottom and using 50Hz/step takes a long time
An built-in frequency display would be nice option.
Steve we're never going to leave you alone. That's it for now!

Steven Weber <kd1jv@...> wrote:
Recently, I found a 80 MHz 3.3V clock oscillator I had forgoten I had. Must
have ordered it for something and never got around to that project. So,
today I tried an experiment. I hooked it up to one of my few spare AD9834
chips from the most recent lot and fired it up. Amazingly, it has output!
Kinda thought it would, as AD respce'd the part to work at 75 MHz and
didn't change the part number. And if it could be pushed that high, why not
a little higher? Anyway, apparently 75 MHz isn't a stock clock oscillator
freq where 80 is.

Now to change the reference freq numbers in the MPU, design a new filter
and see if it will work up to 10 M. With an 80 MHz clock, it should be just
do-able.

But this rises the question of what to do with this new insight. An ATS-3B
which covers 20-10M?

Ahh, good old feature creep. It is tempting, but I hate to abandon the Altiods tin form factor. It makes such a cute little radio, which is why many of you bought one :-)

The easiest thing for me to do is stick with the current ATS-3A board. Maybe with some minor revisions and clean up. I might have to squeeze another section onto the DDS filter. There could be a "secret" band select mode so those who have a ATS3A already could use the low band modules too.

Well, the first thing to do is to build up the rest of the board and see how well it all works.

Clever use of the existing 2 band-ID lines will get you 5 additional band-module IDs. Have the processor drive one low and look for a change on the other. Use a jumper, diode or transistor (inversion) between the pins, grounding none.

Dave

YES! Please keep the A-tin forum factor by all means!!! ...go for a High or Low band versions of the kit ATS3 A/low or B/high.

If conditions continue to improve (and they are and will! 17m is open almost every day now) I'd opt for throwing the ATS3b in my pack to play in the high bands with smaller antennas, more DX and the fact less power goes furthur.

Albeit in perfect world it'd nice to have K2 w/ALL options jammed into a Altoids (maybe)? But I kinda prefer the simplicity of the ATS and even it's limitations. It's got the charm of Tuna Tin II with the feature set of the K1 and weighs less than half a TT2 and fit's in my parka pocket. Best yet it can survive bouncing around in the bottom of my pack for many trail miles and still power ready for a Q! Nah, Keep it simple! Altoids size is winner! IMHO.

I'm with N0TU, a little bigger might not be too bad, but not too much. Another feature I like about the ATS is the lack of externally protruding controls, unlike the KX1. The seperate band modules aren't a big problem, since they fit inside the tin for storage. Gotta admit, the capability of the higher bands is compelling, but 40 and 20 still covers it well. It's a great rig for air travel, where size and weight are just as significant as the Spartan Sprint.

Tried to reply to this when it first came out and it bounced (sent my
responce from wrong email acct) - I'm glad because it made me go back
and look at the data sheet(s).

Interresting lesson here:
The data sheet from ON Semiconductor says the TO-92 pinout is D G S
(looking at the flat side). The Vishay data sheet says the pinout is
S G D (same package, same view).

Interrrrestingly, the Vishay data sheet says at the top:
"2N7000-2N7002,VQ1000J/P, BS-170",
N Channel 60v, MOSFET.
In this case I believe the channel is symetrical so that you would not
damage the device but there is a lesson in assuming partnumbers
mean that they are the same (vishay BS-170 and ON BS-170).

I use them interchangeably.

I always use my Peak Atlas DCA55 semiconductor component analyser on parts before I install - it identifies the package leads for you - JFETs, MOSFETs, NPN, PNP, diodes, LEDs, etc., etc. All part of my "check twice solder once" philosophy.

I also have the Peak Atlas LCR40 passive component analyser, and I am really glad now that I purchased the optional surface mount tweezer probes. It's going to make it much easier to be sure what component I am placing on the PCB when building my ATS-3A.

These are the links at Peak Electronics for the above-mentioned:

http://www.peakelec.co.uk/acatalog/jz_dca55.html

http://www.peakelec.co.uk/acatalog/jz_lcr40.html

When I bought mine last year (direct from the UK - I live in New York) they had a special where you got the above two instruments at a discount all packaged in a foam protected case.

586. Wide band mode for ATs-3A

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-08 03:48:52 UTC
From: David
Topic: 586 Message: 586

I have heard tell that earlier versions of the ATS supported a wide band mode with SSB/AM reception. What would be involved in a mod for the ATS-3A to enable support for this?

I would imagine it would require some kind of addition of a CMOS switch or something similar, along with some additional LCR parts to modify the passband on the crystal filter. The CMOS switch would then switch in the LCR to activate the bandwidth change, under the control of the MPU. This would need some changes to the firmware - an added menu item of some sort to toggle the mode.

Has anyone done such a mod?

Dave

I too don't want to see the ATS rigs grow in size.

Since the ATS3 rigs are re-programmable, how about having the software determine what bands it uses at a given time? When propagation on the high bands is poor, just program it for 80-20m. In a few years, a version set up for 17-10m might be more useful. If Steve were able to provide extra band modules, for a price of course, we could have the option of setting
up the radio however we want.

589. Longevity of plug-in band modules?

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-08 12:03:39 UTC
From: John Harper
Topic: 589 Message: 589

One of the many things I like about the ATS-3 is its huge capability:size ratio. But every time I change band modules, I wonder how many more times I'll be able to do that before the mechanical stress takes its toll on a solder joint or the electrical integrity between the pins & socket.

Hopefully these concerns are unfounded but any time a moving part is involved, friction eventually creates a casulty somewhere. Althought he small size would be compromised, a neat accessory (or new design) could allow all band modules (4 or 8!) to all be plugged in simultaneously with bandswitching done with a press of one of the switches. It would still be the smallest multiband rig around and, if it included 10-20 meters, it would be a one-of-a-kind.

Just my thoughts on a very cold morning,

John Harper AE5X

Dave,

If you can check the schematics for the 3 version you
will see what hardware is necessary. Basically a
switch that bypasses the crystall filter. However,
since the 3A uses a different way to mute the rx
during transmits I am not sure without looking at the
schematics side by side whether the firmware will
handle both in the 3A. I will check later today and
get back unless someelse does first.

Hi John,

I use this little rig exactly for one year - nearly every day as my main rig. There is no sign of weakness. The only repair was the "frequency down" button wich is a blue one now. Changing it was not a great issue. Neither would be the socket for the BMs - all inexpencive standard components. I am optimistic about that.

592. Error in QBSA instructions

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-08 13:34:47 UTC
From: Bruce Beford
Topic: 592 Message: 592

I have found an error in the assembly instructions for the QRP Base Station Accessory (QBSA).

The QBSA includes a variable voltage power supply section. The output voltage is controlled by a front panel pot. The instructions state that when connecting the ribbon cable from the display board to the main board for this pot, to put a twist in the cable between the two boards. This is supposed to make the pot adjust the voltage in the proper direction. i.e.- full CCW is lowest voltage, full CW is highest voltage. This will not work. Regardless of how you wire this cable, the pot will always work 'backwards' from 'normal. So CCW is highest output, CW is lowest output. This is because this pot is used as a rheostat, or simple variable resistor, not a potentiometer (resistor with a variable tap).

To get this pot to 'tune' correctly, connect the two conductor cable as follows: install one lead into the hole that connects to the wiper of the pot. Connect the second wire directly to the lead of the pot that is NOT connected to the original hole for this wire. In other words, use the opposite end of the pot from what the PC board is wired for. Viewed from the back of the display board, this is the potentiometer lead that is closest to the display. Connected this way, fully counterclockwise will be about 6 volts out, and fully clockwise will be about 11 volts out.

72,
Bruce N1RX

The crystal filter has to be disconnected completely because it receives on
the wrong sideband for SSB on all bands but 40. In the ATS-3, an IF
transformer is used to give it some sembalance of selectivity when in Wide
band or DSB reception mode. I had to take the IF transformer out on the 3A
to make room for better Rx input filters. Trying to make a 3A work like a 3
would not be easy and I would not recommend trying.

If it were only that simple!
Besides additional band modules and a new firmware program to support these bands, the DDS clock has to be changed to 80 MHz (getting those clock oscillators off the board once thier soldered in place isn't easy!) The 74HC02 PA driver has to be changed to a 74AC02 type, all the components in the DDS filter have to be changed and that's just what I know about at the moment.

I have a board built up with these changes on it now. Maybe by tomrrow I'll start on making filter modules and see how it works.

Hey Mike and the gang;

I am also in the "keep it the same size" group.

I like your idea, but would suggest using a main board mounted header-based switch for the (high ordered) 3rd bit. i.e. a simple header that allowed for the extra bit in order to get more band module selections without having to reprogram the unit.

From: Karl Larsen
Topic: 599 Message: 599

I went to the post box and I found a kit from Steven. It has a CD-Rom in it and I will print that out soon. I will see how hard it is to build. And then figure out what to put it into. It looks like we will have to provide 12 volts DC.

600. Results of High Band ATS-3A experiments

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-09 19:18:41 UTC
From: Steven Weber
Topic: 554 Message: 600

First the good news:

I've got the rig working on 17/15/12 and 10 meters. Power output 2.5 watts or better on all bands at 9V input. PA effiecentcy looks to be running about 64 % on average. Tx spurs are -50 dBc on all bands but 10, where the worst are -40 dBc. Minor changes in the spacing of the turns of the LPF toroids make significant changes in power output. I ended up using the same value caps in all the filters, the only difference being slight changes in the number of turns on the coils and the turn spacing.

Now the bad news:

As expected, the operating idle current went up significantly, from 27 mA for the stock ATS-3A to 43 mA for the HB version. A more troublesome problem also became apparent, major keyclicks and raspy sidetone in the audio on the 12 and 10 meter band. Worse than normal on 17 and 15 also, but not nearly as bad as 12 and 10. I think it might take a higher current output 5V regulator to fix that problem.

Back to tinkering...

601. QBSA Packaging Ideas

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-10 16:49:33 UTC
From: pdouglas12
Topic: 601 Message: 601

My QBSA arrived today, and I've printed out the excellent instructions from Steve. It looks straightforward. As suggested in the instructions, I am thinking that a somewhat larger package could include a speaker, headset jack, and UHF or BNC connectors for RF input/ output. But, I am wondering if any fast builders have already got their QSBA wired up and connected. If so, how about a few pictures? It would probably help us all to see how you did it. And what did you use for cables/connectors for fast mating between the ATS-3(A) and the QBSA. How did folks handle holding/tilting the ATS, so its controls are accessible?

Also, Steve, could you give a figure or photo showing the exact point to pick up the DDS output on the circuit board. I presume I can do it from the schematic, but I wouldn't mind some reassurance; plus, there surely are others who would benefit from a picture showing the take-off point to which the recommended 4.7pf cap should be tacked. Is the takeoff point physically the same in the ATS3 and ATS3A?

Preston (and all),

I have my QBSA working, but the packaging is not finished yet. I am building it into a small metal project box with ventilated lid, like they (used to) sell at radio Shack. I have the front panel cutouts all done, and I'm laying out the rear panel connections. I am going to use BNC connectors for the TX in and ANT out connections. For the other connections to the ATS, (DDS out, phones out, power in) I am going to use a female 8-pin mini-din connector I have. This way, I don't have to drill so many holes in the case. A male 8-pin connector will have RG-174 coax for the DDS signal, another shielded cable for the audio out of the rig, and a two conductor cable for the power to the rig. So this one cable will actually have 3 seperate connectors off of it. I'll post pics of this as it comes together.

For the outptut of the DDS signal from the ATS3, I have made my connection to pin 20 of the AD9834. I actually connected to C37, which is connected to this pin. This output from the DDS chip is terminated, but unused in the ATS circuit. It has the same signal as the pin that feeds the low-pass filter, however. I used this pin to avoid disturbing the output pin actually used by the ATS3.

For a picture of how I made this connection, take a look in the N1RX ATS3/3a photo folder. Look at the pic titled "DDS Out for QBSA". There is a detailed description of the connection attached to the photo.

>Also, Steve, could you give a figure or photo showing the exact point
>to pick up the DDS output on the circuit board. I presume I can do it

I couldn't get a picture which was very clear and the best I could do is
the one in the manual. The cap is tacked to the side of the inductor in the
DDS filter (L1 in the ATS-3A), the end closest to the edge of the board.

604. QRP Base Station Accessory built and working!

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-11 01:53:50 UTC
From: Bruce Beford
Topic: 604 Message: 604

I have just finished packaging my QBSA. It is mounted in a small metal project box. It measures 3 1/4 inches wide, 2 inches tall, and 3 1/2 inches deep. I have constructed a 2 foot long cable assembly to connect my ATS3. The QBSA will sit on a low shelf on my desk, with the cable tucked away until needed.

I have posted pictures in the N1RX photo folder. I have not done any panel labelling yet. That will come later.

The unit is working very well. The only issue I have is a moderate thump from the speaker on key-up when running over about 2 watts. I suspect perhaps I'll need to add a beefy filter cap for the variable regulator, or perhaps just a heavier DC cable to the rig. For now, I am satisfied, and it's working well.

Thanks for the nice add-on, Steve!

72,
Bruce N1RX

Steve, Thanks for your note, and Bruce, that's brilliant! And congrats on the neat job too. That's the kind of planning that makes a project like this even better. You've figured a way to make hookup and separation fast and convenient, which makes it like a docking accessory. The pictures are really very helpful too.

If others have done interesting things with their QSBAs, please let's see them in the pictures section. They are really helpful and inspiring.

Bruce,

Where did you tap the counter input into the ATS-3 to get the frequency readout? I had tried to do this many months ago on my ATS-3 using an FCC-1 with a small cap, but everything I tried just killed all reception. Same technique works great on my NC2030, however.

607. Filter Module Storage in Box Lid

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-11 19:33:25 UTC
From: radio_kx0r
Topic: 607 Message: 607

All four ATS-3A filter modules will fit inside the Altoids box without interference with the main board! Take a look at the photos I posted here, and the idea is easy to see. Three boards are held in the lid of the box by plastic 4-40 x 5/16" screws and small threaded standoffs. There's enough room, provided the placement is accurate.

This idea is mainly for backpacking use, to avoid losing or damaging the filter modules. This idea isn't right for everyone, since you have to drill holes in your filter boards and box lid, and there's some risk. You have to measure and fit the boards carefully, as there's only about 1 or 2mm to play around with in each direction.

At least one, and preferably two, of the filter boards must have two corners rounded as shown in the pictures. That's the only way to mount one of them far enough toward the end of the box lid, so the other two boards will fit. The 20M and 80M boards are the ones to be rounded - don't round the other two. In addition all four boards must be shortened by 2 or 3mm at their bottom ends. This is easy to do with large dikes. Be sure you don't cut or file too deeply and remove too much of the ground traces on the boards.

The reason to shorten the boards is that there is a clearance problem between the bottom end of all three boards and the back lip of the box bottom as the box lid swings down in an arc. This isn't obvious at first!

Two clearance holes must be drilled in each board. I used a #33 drill for my 4-40 screws, and there's just enough room on the boards - unfortunately the band labels are right where the holes must go. You might choose smaller hardware if you can figure out how to screw on the standoffs or whatever you use for "nuts" to hold the boards in place in the lid. I use small threaded standoffs and that fit a Heath nutstarter - fingers will work, but the nutstarter is better. Don't use a nutdriver because you might damage parts on the boards.

I ended up gluing my various toroids to the filter boards with a bit of 5-minute epoxy. This helps keep them where they belong and may avoid damage if they catch on something during handling.

Hopefully some of you will have better ideas, or take this one to the next level. The threaded standoffs are a bit tedious, and there might be something like little rubber plugs that would just push on and stay well enough to hold the boards.

I thought of using Velcro to hold the boards inside the lid, but I decided it would be too thick for the third board, plus I didn't want to glue Velcro to the back of my filters.

Thin sheet magnetic material - like for refrigerator magnets - might work, since it will stick to the Altoids box lid. The stuff I have here isn't strong enough, however, and it would have to be glued to the back of the boards.

I though of using more SIP sockets to hold the boards by their pins, since that would allow easy swapping, but I couldn't work out the orientation. Others have used foam to hold the pins for storage - this idea is on some of the photos posted here - but it won't fit.

I tested the ATS-3A with all modules stored inside the box, and I'm still getting more than 5W on all bands, with 12.0V in. Opening and closing the lid has no effect on the power output. If you try this mod, be sure to retune the trimmer caps on your modules when you're finished.

Last night I finished my Base Station Accessory for my ATS3 and tried it out. I reported hearing a thump on key-up. I am happy to report this has been resolved. I was using a straight key last night for my initial contacts. I had a 'less tyan optimal' cable connecting it to the ATS3. This morning I disconnected the straight key, and tried a set of paddles. No thump! I can confidently say my troubles were not due to any problem with the QSBA. She seems to be working fine..

Nice job, Bruce! One of these days I am going to get some time and
build my QBSA.

The audio keying thump while using a straight key is a known issue and
is fixed by Steve in all the latest versions of firmware. This "thump"
is only in the audio feedback and not transmitted on the air. If you
are using a recent firmware version and still have hear the thump,
please let me know and we will dig back into the firmware...

611. ATS3 80M Power?

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-11 22:14:59 UTC
From: Jim Miller
Topic: 611 Message: 611

Finally got around to winding the toroids for the 80M module for my ATS3(non-a).

It was a really tight squeeze getting all 23/24 turns on the coils but I made it without overlapping anything this time. After I finished and counted the turns for the third time I made sure the turns were approximately evenly spaced on the toroid outer edges.

I brought it up on the ATS3 and tweaked the capacitor as usual then put on a dummy load and checked power.

The power out is about 4W with 12.7V in from a gell cell.

That's about a watt lower than I've seen on the other bands for that input voltage.

Is that normal for 80M?

Date: 2006-12-12 12:20:48 UTC
From: kr5l
Topic: 613 Message: 613

Hi ATS fans,

Well, I moved to Florida and left my ATSIII in a storage building in Oklahoma! Bummer. So I ordered the new ATS3A AND the QBSA kits. I finished them both and everything works as advertised!! The only mistake I made on the ATS3A was soldering in R2 and R4 in the wrong orientation... In the process of 'correcting' my error, I wiped out R2 --- I replaced it with a 1/4W 10k resistor.... I didn't have a spare SMD 103 resistor laying around. I didn't want to wait for a replacement part. I had to re-heat the four pins on the 50MHZ oscillator to get the DDS chip to come to life.

I tapped the DDS output on pin 20 as suggested by N1RX... works great! Thanks Bruce.

Thanks and KUDOS to Steve for yet another fine job of engineering and packaging. Now comes the fun part.... packaging. There are a lot of good suggestions on the reflector.... I have some ideas of my own that I would like to try.

Keeping the solder fumes aloft,

Jerry Henshaw

I've made a label (work in progress) for my ATS3a which is a PDF in the file folder. It's sized smaller than the Altoids tin so it'll fit between the screws and just rest close to the push buttons. The plan is to print it then get it lamenated an cut it out leaving a 1/8" border of clear lamenate and adhere to the Altoids surface to align with the push buttons. I may punch holes in it for the buttons if I can find the right size punch ...have see what works best on this.

I'm in the brain fade phase of the human life cycle and having the cheat sheet on top of the case is a must for this old goat! I'm still editing the MENU text to be as brief as possible, less redundant and still make sense. Any thoughts or suggestions would be helpfull? (PDF label is the group FILES under N0TU's ATS3a...)

On module storage I'm only seeing it possible to squeeze one (maybe 2?) into to Altoids lid? But this is my next task. Mean while I'm having more fun just using it!

Tks Steve/n0tu

Hi to the group,

I'm a proud owner of an ATS2. I've been using it during my business travels for the last two few years. I know that the ATS3/A is smaller, but I love the fact that the ATS2 came with a pre-punched, labeled case.... a very good thing!

I've been thinking of ordering the QBSA, but I would like to review the manual first. The manual is not currently available on Steve's website (or perhaps I just can't find it), so I was wondering if someone who has received the kit could post the manual to the file section of the group (with Steve's permission of course).

Thanks in advance for any help.

Hi,

I think one can get the BLT box from Hendricks QRP kits here:

http://www.qrpkits.com/barecase1.html

At least it looks that way. You could also get the BLT kit too.
I already have an EMTEC ZM-2 to build but a modified BLT for balanced/
unbalanced antennas or an ALT for the plain longwire might be smaller to
carry.

I do not think the QBSA will fit.

Correct. The "bare case 1" is too small by about 3/8" in width and height.
Too bad..

Darn,

Sorry, I should have looked closer. I wonder if that means
the BLT is in a smaller case.

Mike (and ALL)-

I loaded your latest firmware (ATS3_m36) into my ATS3 and the straight key thump is gone. I must have loaded an older version into the ATS3 at some point. Unfortunately, since the MPU has no way to report it's firmware rev level, I have no way of knowing what was actually in there before. In any event, it's working well now. You can stop sweating, hi. Now just need to recal...

Once you enter cal mode you will hear (in cw) the
version of firmware that is loaded. This is recent
(within the last year) for both Steve's and my
versions.

630. ATS-3A Frequency Capabilities

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-14 06:24:04 UTC
From: radio_kx0r
Topic: 630 Message: 630

I did some tests and found that my new ATS-3A with V2 firmware can operate on various frequencies outside of the normal tuning range accessible by the Up-Down buttons. There is a way to cross some of the tuning barriers using direct frequency entry.

I've summarized my findings in a Word document posted in the Files section here. Depending on your version of firmware, your radio may perform differently. In any case, please read the document before you start playing around with your radio.

Be careful when using Direct Entry mode. Your radio may be able to receive and transmit outside of the amateur bands if you goof up a Direct Entry command. If this happens, just cycle the power off and on and re-enter your frequency.

Some of these capabilities are useful features for some of us. I'm interested in hearing from others, because you may discover some things I haven't found. Remember that your radio wasn't designed to go outside its intended ranges, so don't push your luck...be gentle.

From: karllued
Topic: 631 Message: 631

I have been looking for a nice set of in-ear type earphones for the Sprint-3A, and found some finally. They are Coby CV-E91. I got them for only $14.95 at FYE, a store in the local mall. I prefer in ear type with the soft rubber plugs, but the really nice feature is they have a small volume slide built into the cord. I find on really strong signals, the volume gets a little loud, and this little attenuator is just the ticket. Of course I have no finacial interest in any of the products or companies I mentioned. They are not high fidelity, or expensive!

632. RE: [AT_Sprint] Nice in ear headphones for Sprint

Is there a spec on the package for sensitivity? I am currently using some Koss earbuds with soft rubber plugs, with the highest claimed sensitivity of all that I have seen. The audio on my ATS-3A seems louder than my ATS-3. The volume slide control would have been handy during the last Spartan Sprint. My noise level was deafening.

I saw no spec on sensitivity of the headphones, but I took the radio to work to maximize the 40m module. With a signal of -126 dBu at the antenna in jack, I could detect the tone in the headphones. This was the smallest signal the generator would produce and remain calibrated. With normal atmospheric noise, this is all the sensitivity you would ever need.--- In AT_Sprint@yahoogroups.com, <andrew.macallister@...> wrote:

638. Stupid Question

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-15 19:42:22 UTC
From: jimcur134
Topic: 638 Message: 638

Sorry if my question is too primitive. Most of you seem like quite sophisticated amateurs.

I'm really a newbie. I've just learned Morse code (pretty easy, but not trivial), and I'm studying for the licensing exams. I've built some electronic kits in the past, and I follow directions with very great precision. Complexity is not my enemy.

I want to build a QRP radio for several reasons. I want to learn something about circuitry. I want the learning that comes from making mistakes, finding them, and correcting them. So, I'm willing to contribute my share of sweat to the process. However, when I'm done sweating, I don't want a toy. I want a radio that works competently. It should work off a power supply at home, and it should work off a battery when I'm backpacking. It should be a real radio and not some ridiculous toy that half works or works intermittently.

I've tried to scan as many QRP rigs as I can, and as far as I can tell the Sprint IIIA is about as good as it gets. Am I right? Does it compare decently with the German radios (Tramp 8, Mosquita)?

As far as I can tell, nothing available is remotely comparable to the Sprint IIIA. This appears to be ten times as true if we just measure value per dollar.

If all this is true, is it a good time to buy and build this rig, or will there be a Super Spring IV with more bands and full voice and a DVD player available pretty soon?

Sorry if my questions bother your list.

Regards,
Jim Curry

Hi Jim,

At the risk of oversimplifying the answers:

Yes, it is a good time to buy and build this rig, if
any are left.

Yes, there will always be other rigs in the future
that you will want to buy and build.

Thanks for posting Jim, and welcome aboard!

In my (not so humble) opinion, the ATS3A gives you the most bang for the buck in the multiband transciever kit market right now. For the cost of some monband transceivers, you get a very competent 4 band rig, in a VERY compact and power-thrifty configuration.

If the thought of the SMT construction does not bother you, and you are a methodical builder as you say, you should not have any problem with the build.

If you want a super full-featured multimode all band MF/HF rig, then the Elecraft K2 is for you. That's not a backpacking rig, though. Two very different animals.

I have built all of the Elecraft transceivers, most of the products from Small Wonder Labs, a few from Oak Hills Research, most of the NorCal rigs and derivatives (ie Red Hot Radio, Wilderness Radio), as well as many other specialty kits. I have also built just about all of Steve's (KD1JV) kits.

I haven't yet done any of the DL-QRP-AG kits, though. (hmmm... gonna have to address that!) The Tramp 8 is a much larger, heavier unit. Also, the Tramp 8 will cost you over twice the cost of the ATS3A, when you order 4 band modules with it. The receiver front end will do a better job of holding up under all the shortwave broadcast interference they have as a fact of life in Europe. We don't have the level of problems with that here in the US, however.

As for what Steve may have up his sleeve next.... I wouldn't wait. It looks like the current run of ATS3A's may be the last, and there are only a handful left. If you are thinking of buying, I suggest you send an email off to Steve, and see if he has any left. Let him know your check is on it's way, and he'll hold one for you.

Steve's been experimenting the past week or so on the feasability of a higher-band version of the ATS- as in 17, 15, 12 and 10M. That's a work in progress. With Steve, there is always a work in progress....

Hope this helps...

If your main interest is morse code, which is what I discovered I liked best after spending about $2000. on a Kenwood TS-690S, brand new with EVERY option in 1993, I can honestly say the Sprint 3A is a quieter receiver than the Kenwood. The Kenwood will do voice/digital modes that the Sprint won't do, it covers more bands, including 6m FM, and it puts out 100w, and I installed the automatic antenna tuner which is nice, but if you want a CW rig, the Sprint works better, and is more portable, and CHEAPER. Another rig you might consider is the Elecraft KX-1. Several people have told me this is a nice radio, but by the time you put in some options, it can get into your wallet. The only advantages I can see to it is an optional automatic tuner built in, all the filters for every band are there simutaneously, and it has an ?optional? paddle that connects to the side of the rig. NO HF RADIO WILL WORK WELL ALL THE TIME, you will always be able to talk across town, but the band conditions affect most other communications. I look at QRP like hooking a sword fish on 10lb test. It is a lot more sporting! I live in NM, and have been able to contact the east coast regularly, (around 1900 miles), over the past couple of months with poor band conditions. It takes very little power to make a sucessful CW contact.

Jim,
Welcome aboard!!
I'll TRY to keep this short.
you wrote:
>>""nothing available is remotely comparable to the
Sprint IIIA"<<<
Yes...IMHO yes I believe that.
I have built a K2/KX1/lots of stuff from SWL...and THEN there is KD1JV....YIKES!!! Steve's stuff is in a class all by itself!! Steve is a GENIUS...he is so far ahead of any other designers out there!!! I truly believe there is NO comparison!!! The receiver on the ATS-3a is incredible!!! I have done comparisons with my FT-1000 and I'm so impressed with Steve's ATS-3a!! BTW...the other mulit-band "backpacking radio" tht I built and own, the KX1, gives me about 2 watts out with a battery but I can get 4-5 watts out with a battery pack with the the ATS with a FRACTION of the weight. The KX1 weights almost a HALF POUND more than the ATS-3a!!! I've built three of Steve's rigs so far and starting on the second one I test the band modules out by chasing DX....I know if an EU can hear me on that band module...the module is tuned pretty well :) and I feel confident to go after ANYONE that I can hear with the rig!!!
If you want to get on the KD1JV band wagon hop on quickly...I'm not sure how much longer Steve plans to kit these!!
GL!!!

From: steve_n0tu
Topic: 638 Message: 643

The KX1's filter is 3-pole where the ATS3 is 4-pole which is superior IMHO! On the ATS3 you don't hear the opposite sideband note bleeding through like you do on the KX1.

The KX1 is a nice setup but if your 'serious' about cutting your trail weight down ...again the ATS is wins! Of course this depends on your battery, atu and paddle (key) weights but there's ways to get these down as well.

Lots of choices, too little 'play' time.

Steve

644. New ATS-3 speaks

Yahoo group: AT_Sprint (2002 — 2008)

From: gearjam54
Topic: 644 Message: 644

After months of procrastanation I finally fininshed my ATS-3. It was so nice hearing that "ATS-3" after power up.
So far I've only had 2 problems"
1) a lost part which Steve replaced.
2) I switched D1 and D2. That was pretty easy to find after my 9V input dropped to .25V after D1. And to add insult to injury the instructions clearly state which diode goes where.
Anyway on to finish the calibrations and tests and hopefully another ATS-3 will be on the air.

Larry - NU4B

Steve

I really don't think there is any comparison. The ATS-3 outperforms the KX-1. I know, I have had both, and sold the KX-1! The ONLY advantage is the built in ATU, but even with a separate tuner in another Altoids box, the ATS-3 setup is smaller and lighter. What really decides it? How about $165.00 for the ATS-3A versus $364.00 for the KX1 (WITHOUT the Antenna tuner!).

Hi Jim,

Welcome to the list. I have the Elecraft K1 and K2, and the ATS-3A. As was pointed out the K2 is not really a backpacker's radio, but I find provides splendid performance and features for home and portable use. My K1 offers plenty of performance and use-ability features that make it a pleasure to use most anywhere. It is considerably larger and heavier than the the ATS-3A, but it is still a very manageable size even for backpacking.

The ATS-3A is in a size and weight class of its own. But you sacrifice some conveniences - and this comes down to personal preferences - that you would find on most radios, a tuning knob, a frequency display, internal band switching, audio power for a speaker and maybe some ergonomic features. I find the transmitter and receiver performance isn't all that different between the K1 and the ATS-3A. My side-by-side receiver performance test gives a little sensitivity edge to my K1 (similar IF bandwidths used). In reality the ATS-3A receiver is completely adequate and well matched to QRP transmitter power.

I also built the Elecraft KX1 a few years back and put it on the air. My observation was about the same as others; its 3-pole crystal filter allowed too much opposite sideband signal through. I also couldn't stand the wobbly tuning encoder. It was sold 2 weeks after I built it. Many people really like their KX1. The ATS-3A's 4-pole crystal filter is devoid of the opposite sideband, except in the case of very, very strong signals. Then I might get a hint of it.

My main concern with the ATS-3A are the plug-in module, pin and socket durability. I haven't had any problems in the short time of owned it, but I wonder if it will become a problem at some point. Also, I've noticed that every now and then one of the various toroid's will get lifted off the board. That can easily be solved by squeezing a little elastomeric cement under them.

All and all its a pretty neat little radio with a hard to beat price tag. If you miss out on this run, I expect Steve will be bringing something similar or new along before too long.

'73, Thomas - AC7A (Tucson)

jimcur134 <jimcur134@...> wrote:
Sorry if my question is too primitive. Most of you seem like quite
sophisticated amateurs.

I'm really a newbie. I've just learned Morse code (pretty easy, but
not trivial), and I'm studying for the licensing exams. I've built
some electronic kits in the past, and I follow directions with very
great precision. Complexity is not my enemy.

I want to build a QRP radio for several reasons. I want to learn
something about circuitry. I want the learning that comes from
making mistakes, finding them, and correcting them. So, I'm willing

to contribute my share of sweat to the process. However, when I'm done sweating, I don't want a toy. I want a radio that works competently. It should work off a power supply at home, and it should work off a battery when I'm backpacking. It should be a real radio and not some ridiculous toy that half works or works intermittently.

I've tried to scan as many QRP rigs as I can, and as far as I can tell the Sprint IIIA is about as good as it gets. Am I right? Does it compare decently with the German radios (Tramp 8, Mosquita)?

As far as I can tell, nothing available is remotely comparable to the Sprint IIIA. This appears to be ten times as true if we just measure value per dollar.

If all this is true, is it a good time to buy and build this rig, or will there be a Super Spring IV with more bands and full voice and a DVD player available pretty soon?

Sorry if my questions bother your list.

Reminder from: AT_Sprint Yahoo! Group
http://groups.yahoo.com/group/AT_Sprint/cal

Run for the Bacon
Sunday December 17, 2006
6:00 pm - 8:00 pm
(This event repeats every month on the third Sunday.)
Location: Your shack or anywhere

Notes:
This Sunday evening, the Flying Pigs Amateur Radio Club International will be holding its monthly Run For The Bacon. This is a friendly, two hour QRP CW Sprint, which is open to ALL radio amateurs, will last from 9:00 - 11:00PM EDT (0200-0400 UTC Monday).

You may work stations once per band on 160, 80, 40, 20, 15 or 10 Meters. Suggested starting frequencies are 1.812, 3.562, 7.044, 14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs membership number. If you're not a member of the Flying Pigs, and would like to be; then please cli

648. Celebrating too early

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-19 17:45:29 UTC
From: gearjam54
Topic: 648 Message: 648

Hi all,
Well I guess I started celebrating too early as I have run into trouble with my ATS 3. The DDS output freq at TP1 is 7.7 MHZ. The ref oscillator is putting out 40MHZ. (I guess mine is an older model as I have seen posts talk about 50MHZ oscillators) Anyway that's as far as I got today because of work and was looking for any advice that might help me find the problem faster.

Thanks all - Larry, NU4B/QRP

The ATS3 uses a 40MHz oscillator. The ATS3A uses a 50MHz. I assume you are talking about an original version ATS3. Do you mean when you go into the calibration routine to look for the 10MHz signal at TP1, you have 7.7MHz? Or just when checking that point when not in the calibration routine?

If you are talking about during calibration just skip thru the "CF" calibration and proceed to the "CO" calibration. There was a small batch of ATS3's that went out with a bad value in the "CF" calibration code. and maybe this was one? No way to really tell for sure except that you don't get 10MHz. I will try to find my notes to see what you really got.

If it's not that how bout a few more details to help us narrow it down?

Only the ATS3A shipped with the 50MHz oscillators.

651. ATS-3A Keying Waveform

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-19 20:55:03 UTC
From: radio_kx0r
Topic: 651 Message: 651

If you plan to use your ATS-3A on a high supply voltage, like 10 to 12 volts, you should look at your keying waveform with a scope - then you might do an easy mod to improve the shape of the keying envelope.

When I first looked at my rig, I was running on 9V from a variable regulated supply. Rise and fall times were about 2 to 3 ms, which is fair. By sending dits into a 50 ohm attenuator connected to the scope input, I saw the shape of the RF envelope. I dropped the voltage down to about 6V, and the keying was nicer.

When I kicked the power up to 12.0V, the risetime dropped to less than 1 ms, and the fall time showed a sharp, rectangular edge. We've all heard stations on the air with bad clicks, and QRP rigs can make clicks if the keying isn't shaped right. Keying is modulation, and we have to limit our bandwidth by not modulating with frequencies that are too high, which is what we get with a sharp keying envelope.

Steve Weber designed an effective key-shaping circuit into the ATS-3A. RC circuits control the rise and fall times of the P-channel NDT2955 mosfet Q4 that keys the final power stage. R13, R14, C42, and C43 slow down the on-off transitions of Q4's gate so that the final transistors take a few milliseconds to rise and fall with each dit or dah. In order to get good shaping, the key-down "on" gate-source voltage of Q4 must be above its threshold, and the transitions generated by the RC network must move smoothly through the threshold region, so Q4 modulates the output in a continuous manner. When V+ is raised, the key-down voltage on the gate of Q4 shifts up also, and the RC network no longer makes a nice keying envelope. Instead the mosfet gets pulled on and off too fast. I found that if R13, 22K, is replaced by a 56K resistor, the shaping is pretty good for V+ between about 8.5V and 12.0V; but with V+ below 8.5V, Q4 doesn't turn completely on, and below about 8.0V, the rig won't key well.

It's a puzzle to understand the operation of Q4 on the ATS-3 and ATS-3A schematics, because it's a P-channel mosfet, and it operates "upside down". Making the gate more negative with respect to the source turns it on more ☐ this is the opposite of N-channel devices like the 2N7000's in the radio. Furthermore, Q4 is drawn incorrectly - the source symbol should be at the top, connected to V+, as it is on the board.

Steve has optimized the keying circuit for V+ of 6 to 9V, which is OK if you want to run in that range; but my unit needed compensation to key acceptably at 10-12V. (I double-checked to make sure I hadn't stuffed any wrong resistors.) It might be worth adding a jumper or switch so the rig will key well with high or low V+ supplies.

(For additional information on the keying circuit, please see the longer version of this post in the "FILES" section here.)

Please don't get me wrong - I absolutely love this rig!

From: fixnwrtr
Topic: 652 Message: 652

Now that the FCC has removed the Morse code requirement from licensing, I have seen emails and posts for and against the issue. The FCC ruling affects us all, but how do individual members feel about this?

How do all of you feel about removing the Morse code requirement from licensing? Your comments will be published in the January 2007 issue of the Pikes Peak Radio Amateur Association's newsletter, Zero Beat. Now is your time to be heard. I welcome any and all comments, and will be including the comments on ham radio licenses on cereal boxes, inside Cracker Jacks, grab machines at Denny's. Funny, straight, or just a little wry this is your chance to let everyone know how you feel.

73 as always...

Thanks guys,
for the info. Yes the 7.7MHZ was measured at TP1 during the "CF"
calibration. I will get more details about what's going on, like I said
I had to quit working on it due to work. I will go to the "CO"
calibration also and see what's happenning.
I'll let you guys know and

Thanks again, Larry, NU4B

The glossy apple is always a bit sweeter. Those who passed the code and put it behind them, forever, knew that should it come to push or shove they could do Morse. Without Morse requirements the value of the amateur license will be somewhat diminished.

There are those of us who hold Morse dear. Without the code requirement the filter is gone. Those who might have taken to it will never know...unless we step forward and become better Elmers. Somewhere in the Elmering process we should demonstrate the power of that half-watt on a cold winter night.

When Heathkit went away I thought kits were gone forever. Wrong! Today, we have more choices than I've ever seen before.

Maybe our radio future is back where it began, at the bench with a smoking iron and a fistful of parts.

I'm going to see if I can get a hold of a 56k resistor and prepare to do the swap as I build my 3A. I mean a 12V 1.2Ah battery isn't that heavy and a 12V 7.5Ah batter isn't that really big of a deal to carry around.
I even have an 800maH 12V gel cell that really isn't much heavier than three C cells. That 800maH is probably going to run longer than a 9V transistor battery for crying out loud.

Kurt,

12V is a little high for this radio unless you're real well matched to 50 ohms and very careful - at least that's what Steve says in his manual. The new QBSA regulator only goes up to 11V, which is for a reason.

I get a bit over 5W on all bands at 12.0V, and at 13V from a fully charged gel cel you might be pushing those three little 2N7000's pretty hard. You're right that 800 maH will run a lot longer than a 9V transistor battery - the logic of using a little one-way battery escapes me. I'm using three lithium ion cells, and they run from 12V down to 10V, so that's why I used the 56K resistor to replace R13. If you're planning to operate above 12V, you could go a little higher than 56K, maybe even up to 68K, for optimal keying. Be sure to do tests with a scope to verify your keying.

> KX0R

Hmmmmm,

I've seen the run times with the 9V transistor batteries and yes there are some nice lithium packs out there. I have an 11.1 LiPoly pack to run a tracking transmitter and an unused 800maH 11.1V LiPoly besides the 12V gel cells. Sounds to me that it might be good to come up with a reliable 12V options for those who would like to run it in that fashion. I'd like to use mine in the base station mode with the QBSA and as isolated as I am, it would be nice to get the full 5 watts out of the unit.

My immediate answer is that I had to learn code at 20 wpm to get the full freq. allocation and the (never previously issued) 4 digit call. More importantly, I would not have bothered had it not been a requirement. Along the way I found a great new mode. And it is now my preferred mode on HF. I run 99 % cw below 30mHz and all of it at speeds greater than 25 wpm when I can get the other guy to go faster.

I fear that soon we will be asked to stop licensing by testing all together. The history of changes to the FCC's licensing system over the past four decades is sufficient proof of where things are headed.

From: Rob
Topic: 659 Message: 659

I've ordered a QBSA and expect to get it this week. I'd like to look over the manual to see what changes I'll have to make to the ATS-3A. I know I'll have to tap the VFO. I'll probably put another RCA jack on the Altoids case for that. Are there other mods I'll have to make? Will Steven allow a copy of the manual to be put in the files section? I'd like to be able to read it before my kit arrives.

Rob-

I've posted a copy of the QBSA manual. I'm sure Steve won't mind. I'll pull it if he does. Yes, you will have to add another output for the DDS signal. Steve suggests one point of tapping off this signal in the manual. I used a different approach. Look in the N1RX photo folder to see where I connected the DDS output on my ATS-3. There are no other mods needed for either the ATS3 or 3A.

662. ATS3 Not Working..Help!

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-20 19:49:01 UTC
From: guitarbuilger
Topic: 662 Message: 662

Hi all !
I'm a new member trying to get on the air with a ATS3.
I've just completed building my ATS3 which I had around for about a year now.
I'm having a few problems...

1. somehow the 3.5 reg was shorted but I unshorted it(now OK..was a solder slash!!)

2. no audio at power up.,,but I'm hearing the normal speaker rumble noise as it powers up but no "ATS-2" <<not sure why it should be that message if I have a ATS3 anyways no audio message

Question
Is there a recommended mod list for the ATS3 version..I getting confused by all the mods etc and now there is the new version.

Is there newer firmware as well?

I'll kept plugging away..maybe make the a DC probe and an RF one too, looks like I might need them for testing.

Thanks to anyone who can help.

Hi David,

Welcome aboard!

The rig sounds off ATS-2 because with no filter board connected it thinks a 20M filter board is connected. The 2 is for 20M. Otherwise you might hear ATS-8 ATS-4 ATS-3 if other filter boards are connected.

First thing I do when I get no audio is get the schematic out and then check each part in the audio chain and from the MPU to the audio chain. Look at each part for orientation and soldering under magnification. If that is good, then sometimes reheating each joint can help. Especially check the xtal oscillator (the 4 solder joint one). This part will cause the MPU to not work if it is not oscillating properly. Most often reheating the solder joints on this osc will make a big difference. Try these things and let us know what you get. We can proceed from there. Btw, what test equipment do you have access to?

There is new firmware available, both Steve and myself have updated version since you bought your ATS3.

As far as mods go, I recommend you build it stock first. Then if there is anything you notice comb the archives to see if it has been addressed. Most mods are for minor things that most folks won't care about. The rigs simply work great from the gitgo.

>1. somehow the 3.5 reg was shorted but I unshorted it(now OK..was a
>solder slash!!)
>

Shorted how? If the raw DC input was shorted to the 3.5V output, that could be a serious problem. (I really don't like the way they set up the pin out on these regulators, having Vin as the center pin can be a problem if your not real carefull)

If that was the case, at a minumum, the MPU will need to be replaced. Depending on what voltage you used to intially power up the rig with, everything else which is powered by the 3.5V regulator could also be damaged. If you used a weak 9V battery as suggested in the manual, then the other parts are probably okay. If you used a 12 volt 7 Ahr gel-cell, then all bets are off.

Assuming there are no damaged parts, the most common reason for not hearing the side tone messages is a missing or bad solder connection to one of the pins on the little mute switch IC. If you plug in a paddle and key the rig and hear the audio hiss switching on and off, then everything is working okay, but the side tone isn't making it to the audio amp.

If it seems the processor is fried, I'd suggest sending back to me for repair.

I think this might be the answer to Radio Shack's sales problems!
Just put a 1500 watt rig on the shelf at Radio Shack, with one of
their knowledgeable sales persons, who can whisper into your ear upon
purchase, "You know you are suppose to have a license to operate
this, but I won't tell". Then cut funding to the FCC! Hopefully,
with the internet available, there won't be another radio boom like
what happened in the '70's with CB.

But with rigs like the ATS-3 and all its brothers and sisters, and
soone to be models, it is much more affordable to get on the air. Yes,
the multiband rigs cost a lot, but there are affordable HTs that don't
need a lot of experience or code to use.

The back pin which is VIN I believe was in fact shorted to the output
and Murphy's Law would have it that I used a bench supply for
VIN ...crap!! I was in a rush..never pays..the unit was set to 11-
12VDC and I did see the current meter jump up to 2A.
After I got it unshorted (and turned down the PS to 9VDC)I noticed
that 40MHZ osc was OK.

I should have read the manual closer...I checked only the input plug
and not the RAILS..the diode isolates the rails... I more then likely
killed the MPU?. I'll check in the morning. Is there a easy test?

If I was to send back would you need the filter cards as well?
Just let me know the costs and I'll send back a money order.

I must say I enjoyed building THE ATS3 and think I'm not as worried
about SMT now that I engaged into this.

Thanks for your help,
David

Thanks Mike I feel welcome already.
I did get a response from Steve Weber that indicated I might have toasted the MPU via the 3.5 Reg short. (see my reply to Steve for the details)
So I'll check in the morning.

Do you know of any MPU go no go tests?

As far a test gear I have a 60MHZ digital storage scope, DVM , and a frequency counter.
I'm pretty experienced as I design and program circuits (not much RF)..but I was in a hurry and wanted it working before Christmas...oh well at least I know I like working with SMT!
Thanks again hope to work with you soon(CW)...and I'll keep you posted as to how this problem gets resolved.

That is a bad sign. But do check the 3 volts now and see if it is
really 3 volts. If your lucky a capacitor might have died. If not then
you will be smart to send it to Steve.

Perhaps, but I don't think one is going to see a large influx
of people into ham radio simply because the CW requirement has
been dropped. Times have changed. One can email, use an online
internet phone essentially for free, FGRS radios for short range
communications.
You will still have perhaps a trickle of folks who are intrigued by
the prospect of a long-distance contact with a small QRP
radio. I know I am.

Gil,

Using the L7812 regulator is a pretty good idea, but there could be a problem. The L7812, like most of the 78XX group of regulators, has a dropout voltage of 2 volts typical at 1A. This means that if we have an input of 13.6V, and a dropout voltage of 2.0V, our output is at 11.6V, which means the regulator "drops out" of regulation and does not function correctly. We need to supply a minimum of 14.0V to stay in controlled regulation. In the real world we need to supply at least 15.0V, measured at 1A, to provide some margin for voltage sag, resistive losses, surges, transients, etc. In commercial practice we would probably supply at least 16V or 17V nominal on the input.

A better idea for an input of 13.6V would be to use a low-dropout regulator. Therer are many possibilities here, but a quick look shows that Mouser sells the ST L4940V12 as their p/n 511-L4940V12 for $1.48. The data sheet link is:
http://www.st.com/stonline/books/pdf/docs/2141.pdf
This 12V output device has a dropout of about 0.5V at 1.5A and looks like it would work well for dropping 13.6V down to 12.0v. This is a TO-220 device, and it would need a small heatsink. The specs indicate it would handle the ATS rigs easily.

I have never used this regulator IC, so my hope here is that someone else in this group would comment or recommend this or another device.

The QBSA won't handle the problem of dropping 13.6V to 12.0V, since it uses the LM317T and has similar dropout issues, plus there is a an additional dropout from the 1N4007 reverse-protection diode; also the design maximum voltage output of the QBSA is closer to 11.0V.

A crude but effective way to drop 13.6V to about 12V is to put two diodes in series with the supply line. These can be 1N4001, 1N4004, 1N4007, 1N5401, etc. Each diode drops the voltage about 0.7V.

Good luck!

It *does* depend on how much current you're pulling through them. As an example, a 1N4001 has .6V drop at 10mA, but around a volt at 1A. If you have a dynamic load, your voltage will bounce around a bit, more or less depending on how many diodes you're using. It's not a very elegant solution.

Gil,

No, the fuse won't prevent the dropout. I've played around with the LM317 and 78XX series of regulators enough to know that running any of them close to the dropout point isn't good practice. The output voltage may not regulate during the keyed wave, possibly causing problems in how the keying sounds.

Please read my other post (and word file in the "Files" section here) that discuss the keying shaping and possible mods you may need to run at 12V. This is another subject, not related to the dropout issue.

To: AT_Sprint@yahoogroups.com

All four ATS-3A filter modules will fit inside the Altoids box
without interference with the main board! Take a look at the photos
I posted here, and the idea is easy to see. Three boards are held in
the lid of the box by plastic 4-40 x 5/16" screws and small threaded
standoffs. There's enough room, provided the placement is accurate.

This idea is mainly for backpacking use, to avoid losing or damaging
the filter modules. This idea isn't right for everyone, since you
have to drill holes in your filter boards and box lid, and there's
some risk. You have to measure and fit the boards carefully, as
there's only about 1 or 2mm to play around with in each direction.

At least one, and preferably two, of the filter boards must have two
corners rounded as shown in the pictures. That's the only way to
mount one of them far enough toward the end of the box lid, so the
other two boards will fit. The 20M and 80M boards are the ones to be
rounded - don't round the other two. In addition all four boards
must be shortened by 2 or 3mm at their bottom ends. This is easy to
do with large dikes. Be sure you don't cut or file too deeply and
remove too much of the ground traces on the boards.

The reason to shorten the boards is that there is a clearance problem
between the bottom end of all three boards and the back lip of the
box bottom as the box lid swings down in an arc. This isn't obvious
at first!

Two clearance holes must be drilled in each board. I used a #33
drill for my 4-40 screws, and there's just enough room on the boards -
unfortunately the band labels are right where the holes must go. You
might choose smaller hardware if you can figure out how to screw on
the standoffs or whatever you use for "nuts" to hold the boards in
place in the lid. I use small threaded standoffs and that fit a
Heath nutstarter - fingers will work, but the nutstarter is better.
Don't use a nutdriver because you might damage parts on the boards.

I ended up gluing my various toroids to the filter boards with a bit
of 5-minute epoxy. This helps keep them where they belong and may

avoid damage if they catch on something during handling.

Hopefully some of you will have better ideas, or take this one to the next level. The threaded standoffs are a bit tedious, and there might be something like little rubber plugs that would just push on and stay well enough to hold the boards.

I thought of using Velcro to hold the boards inside the lid, but I decided it would be too thick for the third board, plus I didn't want to glue Velcro to the back of my filters.

Thin sheet magnetic material - like for refrigerator magnets - might work, since it will stick to the Altoids box lid. The stuff I have here isn't strong enough, however, and it would have to be glued to the back of the boards.

I though of using more SIP sockets to hold the boards by their pins, since that would allow easy swapping, but I couldn't work out the orientation. Others have used foam to hold the pins for storage - this idea is on some of the photos posted here - but it won't fit.

I tested the ATS-3A with all modules stored inside the box, and I'm still getting more than 5W on all bands, with 12.0V in. Opening and closing the lid has no effect on the power output. If you try this mod, be sure to retune the trimmer caps on your modules when you're finished.

686. Photos of QBSA in BLT Case

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-29 03:24:51 UTC
From: radio_kx0r
Topic: 686 Message: 686

I just posted 3 photos showing my QBSA built in a BLT case - please see the "Photos" section of this site.

Here are a few points to watch out for (this is the stuff I screwed up or that caused me grief):

1) I would describe the fit as "tight" - I ended up filing almost 1mm off the back edge of the PC board. This may be due to dimensional issues in my BLT case.

2) Trimmer C19 must be mounted below the board if you use the BLT case. Please remember to drill a hole in the bottom of the BLT case for adjustment of C19 BEFORE you mount the board, connectors, and cables!

3) I mounted LM317 (U5) underneath the board per Steve Weber's suggestion, and I fastened it to the bottom of the case with a heat-conducting insulator and plastic shoulder washer. The screw that goes through the shoulder washer must be inserted BEFORE the rear panel is installed - otherwise you can't get to the nut. You could put the nut on underneath the unit - Steve has wisely provided a hole in the PC board so you can access the top of U5 - but whatever you do, don't mount U5 until you're all through drilling holes and fooling around with the PC board.

4) The two pots on the front of the display board have little green plastic blips that protrude about 1mm. You will have to cut them off with flush cutters to get the display board in close to the front panel. This causes no problems.

5) I used separate connectors for every signal - that meant seven connectors on the rear panel. This is a lot more work than using a single multifunction connector - someone else here suggested a DIN connector - nice idea.

6) If you don't yet have a step drill (Unibit), you'd better get one for packaging jobs like this. They are great!

7) I used the "drill many holes and file" method to make the rectangular opening for the display. I ended up a little too large - be sure all your holes are well within your marks. Filing the BLT case is easy.

8) Steve's instructions are very good as far as he goes - read carefully and do what he says. He leaves you with options and choices.

9) The calibration routine works well. Remember that you can use direct entry to get the ATS-3A down to 10.0000 Mhz or up to 15.0000 Mhz after you're all through with your cal. That will let you compare your frequency with WWV. Transmit to a dummy load or attenuator and listen to both carriers together with another receiver - this is a good check.

10) I was not able to calibrate to the exact last digit of the QBSA "dead on" on all four bands after running through the entire cal a couple of times. +/- 100 hz error isn't bad, considering that there are several steps where small errors may combine.

The QBSA is a very nice unit, and a lot of thought has been put into the design. The pc boards assemble very well, and the quality of the layout is obvious, even with a couple of minor errors that Steve mentions. I think if you liked building your ATS rig, you'll enjoy the QBSA kit also!

687. QBSA with 12V Output

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-29 04:17:13 UTC
From: radio_kx0r
Topic: 687 Message: 687

The QBSA kit is designed to deliver no more than 11 volts DC power to the ATS rigs that connect to it. The LM317T regulator circuit adjusts from about 6V to 11V. Steve Weber even added a zener diode D3 into this adjustable regulator, so that if you disconnect or misconnect the voltage adjust pot, the output of the regulator still won't go high enough to damage your ATS rig.

Of course there are some of us who want to operate with 12 volts instead of 11....even though we acknowledge that 11V is safer, and Steve recommends 11V for good reasons....

Here's what you can do:

1) Remove zener D3, 1N5231B, 5.1V, and replace it with a higher-voltage zener. I used a 1N4736A, 6.8V, that I had available. The 1N5235B is also 6.8V. A better choice might be a 6.2V zener like 1N5234B or 1N4735A. The zener clamps the Vmax end of the adjustment range.

2) Remove R25, 220 ohms, and replace it with 200 ohms. With this combination you'll now see about 6.3V at minimum voltage, and about 12.7V at the top. This might be too high.

3) I didn't want the maximum up at 12.7V, so I added a 10K resistor in parallel with D3. That lowered the maximum output to about 12.1V. This is nice. I get about 5W out at 12.1V. I have a polyswitch in my ATS-3A, and that drops the supply a tiny bit, so I'm really running at close to 12.0V into the Schottky protection diode on the board.

4) If you run your QBSA up to 12.1V with this mod, you will need to supply at least 15V input. 15.5V is a good choice. Since input cap C8 is rated at 16V, don't exceed 16V input!

5) Please DO NOT run your ATS rig on 12V unless you understand the risk, have a good 50-ohm match, and limit your key-down time.

Please read my other post and word file (Files Section) here about keying problems when running at higher voltages. Even at 11V the key shaping on my ATS-3A wasn't great before I changed it.

Hey,

I found when I have tried to use a stereo headphone with a rig that sometimes I only hear audio in one channel. Is there a stereo to mono adapter plug one could try to get the single channel into both ears?

I don't mean to apply this to the Sprint as mine is not build yet and I haven't gone over the building instructions closely. Might be with the ATS-3(A) that a stereo headphones works?

Kurt

Michael,

There are references to most of the markings on the
parts placement diagrams and within the text of the
instructions.

Regarding the parts in question:

On Page 13 in the diagram (IC, Transistor placement),
you will notice that D2 has an 'A7' annotation above it.

The part itself has this same A7.

So,

From the Page 13 diagram:

D2 - A7 (your A7s 42)
U4 - CC5R

From the Page 16 (Bottom Side Parts) diagram

U12 - SLFJ
Q5 - 2X (your 2X /)

Regarding markings on parts

S256 - The marking is S2 (56 is a date code according to instructions)
This is D1

A7s (42 written at 90 angle to A7s) - A7
This is D2

SL56 (not sure about this one - there is the SLFJ part - U12)

2X /
Q5

I think an earlier posting suggesting that I read
the instructions two or three times before starting was
some of the best advice I have received so far.

It took me a couple of readings to feel confident with
which part was which.

Good luck with your rig. I'm building mine right now too.
Hopefully, I'll have it running before too long.

73,

Richard

695. QBSA Display Freezes

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2006-12-31 16:06:38 UTC
From: radio_kx0r
Topic: 695 Message: 695

I got my QBSA running a few days ago, and it has an interesting behavior. On 30 and 40 meters the unit does just what it should. When you move up or down frequency with the buttons on the ATS-3A, the display reports the changes pretty quickly. Changing the display from khz to mhz mode takes about a second after pushing and holding the function button.

However, on 80M and 20M, the display doesn't update very quickly as I move up or down with the buttons. It sometimes freezes for several seconds, and then the frequency appears to jump on the display. The ATS-3A is changing frequency smoothly and normally, and I verified this by listening to signals while I observed the display freezing.

Likewise, on 80M and 20M, sometimes the display mode won't change from khz to mhz, even when I hold the function button for many seconds. Repeated tries seems to help the mode change from khz to mhz and back. It's slightly frustrating.

When I update the frequency with direct entry, the display shows the new frequency immediately. The transition to FWD and REF power occurs normally, usually without delay, on all four bands.

Has anyone else seen this behavior with your QBSA? It's a minor issue, because the correct frequency is displayed eventually. It's strange that 30M and 40M work well, while 80M and 20M have the delays. Perhaps there's a time lag required for computation while the counter/processor does the math?

Steve, are you reading this? Is this normal for the QBSA?

I really like the QBSA. I'm using all the functions on mine, and they all add to the fun of the ATS-3A. The audio amp provides a nice boost with low noise, and the counter is cool!

John,

It is an interesting little radio. I hope you have fun constructing it. Just remember it is best suited for 9 or 10V supply, even thought it can be used with 12V. A 12V supply results in very fast CW edge rates and the output MOSFETs are really pushed beyond there maximum specifications. Otherwise, it's a solid performer.

Happy New Year!

Humm, had to think about this for a few minutes. Try running it with the
power meter by passed, ie, put the antenna back direct to the rig.

As explained in the manual, to keep the display from jumping around when
you transmit (since the DDS changes from the LO freq to the TX freq), the
display is frozen when it detects power output from the rig. I set the
thrushold pretty low, so it would respond quickly. Maybe too low. Sounds
like the power meter is detecting strong stations and kicking over the
thrushold at times.

The only problem with this "fix" is of course, now the display will now
jump when you transmit.

Hi

Just finished the ATS-3A and 2 band modules - worked first time! very pleased :-).. used the solder paste / heatgun method and it made for a very neat job.

Trying to do the calibration per the manual - but I cannot get into 'cal mode' - holding in the two keys (menu/RIT) gives a different reponse than just powering up - but not ver nr - nor 'cal' - it give me "20m rx" ten after releasing buttons "xttrt" - if you wait for more than 5/10 sec - it doesn't matter if you wait longer....
'ordinary startup' send '20m' only.
Makes no difference if the 20m module is on or not.

Look forward to finding out how to d ot he cal!

Thanks and 72 John VE3NFK

Steve,

I did as you suggested and connected the antenna cable straight to the ATS-3A, so the QBSA RCA jacks are unconnected (power meter not in the loop). I also connected to a 50 ohm dummy load.

No change - the behavior is the same and very repeatable. My bug isn't related to RF in the power meter. 80M and 20M freeze and typically take several seconds to update while I hold down an up or down button, and update is erratic. I can see no pattern or regular interval to it, except that an update will occur after 5 or 10 seconds at the most (no total freeze).

When I try to change the state of the display from khz to mhz, it always requires several seconds before anything happens, and sometimes nothing happens unless I try several times. However, the

transition to the power meter display is normal.

On 30M and 40M everything is perfect and repeatable. The button must be OK.

I'm getting my counter signal through a 4.7 pf cap from R16-C33-pin 20 of U7. I have 19 inches of RG-178 cable, and it measures 53pf including connectors. My first guess was the cable, as I originally had 24 inches. Shortening to 19 inches had no effect.

I did not insert my IC's into the board until after the regulators were tested, and I used a wrist strap and grounded ESD mat during assembly.

I do have a scope, so if you can think of signals to check, I can look.

Thanks -

KX0R

John,

Mike is right - you hold down the RIT and TUNE UP buttons while you power up the rig, and it goes into cal mode. Read the instructions carefully, and this will go OK. I just had to do it all over again several times for my QBSA, and you can repeat the procedure as needed if you get mixed up or whatever. Just remember that your settings must be saved at the end of the cal - read it over several times in the manual - the instructions are good.

Thanks guys - Mike and KX0R .... my bad - pushing on the wrong buttons!

All is well - the 10 mhz accurate to 4 dec places (10.0000) without tuning - the passband came up nicely on the scope and it is a livier beast now - made a first QSO yesterday with KC0JKD in MO - 4 watts out on 20 meters - 3 W on the other bands woth a 10.5V battery pack...

One remaining problem - when it is first powered on it gives the most gawd awful squeal that really hurts the eardrums.. I had put a larger cap in C54 - so thinking I might have done something wrong - I replaced it with the original - still SQUEALS ..
if you repower in a short time it is ok...

ideas please?

so now on to the QBSA !

Thanks for your help...

704. Re: QBSA Display Freezes

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-01-01 17:54:17 UTC
From: Bruce Beford
Topic: 695 Message: 704

I have not specifically seen the 'slow update' described. But I have seen where the response to the function button can be somewhat finicky when the freq counter is measuring a signal above a certain value. I forget exactly where the transition is... somewhere around 8-12 MHz, I forget. If you feed a dds signal into the freq counter, and increase the frquency above a certain point, it has a bit touchier timing on the button to get it to switch frequency readout resolution. It seems a bit harder to 'get it's attention' above a certain freq. I think it might be below 10 MHz where this happens, as I seem to recall noticing it during the initial calibration.

Also, one more thing to keep in mind- when using the QBSA in the ATS mode (as most will do)- The displayed frequency is dependant upon what band the QBSA 'thinks' you are on. It does this based on the frequency it is reading from the DDS in the ATS rig. Steve had to choose certain change-over frequencies to have the display jump to the next band. What does this mean? It means that if you tune outside of a certain range of frequencies on a given band, the QBSA will assume you have changed band modules, and the readout will not be correct. On 80M, I think it is above about 3830 or so..

Stress tested my ATS3a tonight in the Spartin Sprint. Built a snow cave a few days ago with all the snow we had laying around here from the blizzard. Worked SKN New Years with my ft817 and the SP with ATS3a from the cave. Have to say there's no comparison. The ATS wins! When it got down to 15F the display started to fade and the main tuning was sludgish on the 817. But ATS perked right along! =D Although my little Lithpoly battery only lasted about 70 minutes? Fun experience overall! Some pics on my web: http://www.angelfire.com/planet/goatman/CAVE/SKN.html

708. new Bands for ATS3

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-01-02 18:32:44 UTC
From: Lutz Bergner
Topic: 708 Message: 708

Hi

Here comes a small progress report about my last activities. Being warned by Steve's experiments with the 80MHz reference oscillator - I tried to find a compromise between low power consumption- and number of bands. I took 60MHz to cover 17m and 15m besides 160m too. Desoldering of the old 40MHz oscillator was a bit tricky. I finally managed it with two soldering irons. Now the new one works nicely . Had to change the spur filter and and the firmware too. In Steves source of the firmware I once discovered commented out code for 3 additional bands. Later versions don't contend it anymore. One had to hold the menu button down while power-up to reach the additional bands. After discussing the matter with Steve I uncommented the code and changed some well documented values regarding the new reference clock. So far it works, but I think I have to merge in the fixes contained in later versions to be completely happy. One pecularity left. When I power on, the RX does not unmute automatically. A dip to the dot- or dash- paddle cures it till I 'd power off next time. That's nothing I think too much about anyway.
First additional band I built was 160m. The sharp RX was a pleasure in the busy contest this weekend. It puts out 2.5W with 9V. Could work stations all over europe with it. Antenna was the strapped together ends of my doublet feeder forming a T- vertical, driven against heater system. Great fun!
Fotos and schematics will follow soon in my photo gallery.
Next will be 15m. I wonder , if I 'll really have to exchange the 'HC04 with a 'AC04. Of course I already have one. I'll try it at least without ;-).
Stay tuned

72s

Lutz, DL2HRP

I suggest checking the installation of the processor reset chip, u12,
that is mounted on the bottom of the board but had to be rotated from
a normal mounting orientation. It a bit tricky to get all three leads
on the pads when rotated as indicated in the instructions.

Hi John

Well - I got one of Cash Olsen's little paste syringe's; then I warmed it to room temp (keep it in the frige otherwise) - and then using a microscope (you can use a magnifier of your own choice of course) - I put a dab of paste on each smt pad.. a strip on the tiny ic's - then 'carefully' placed each component on the board with tweezers - finicky work - I first organized all the parts so I could keep going when I started - I followed the instruction manual - but put the ic's on last. Then I put the board on a coffee warmer to warm it up; and used a 'proper' heat gun (Aoyue 906) waving it gently over the whole board until the parts just 'clicked' into place...
2 'clicked' the wrong way which was a pain to reposition them under heat - but the board got done and worked first pass.

Hope that helped

I think I ran into one which was doing something like that and it turned
out to be a bad connection somewhere in the audio circuit, so I'd poke
around there some.

John VE3NFK;
That method does sound like the way to go however I certainly
don't have anything that fancy here...Looks like I'll just have to be
careful take my time and use a 1/16 tip on my XYtronic 137ESD
soldering station.

No, fortunately it was NOT the little itsy bitsy 3 legged beasts - it
was one of the L's and a nearby cap - so not to bad to rotate back to
position.

Thanks Steve - I'll give that a look at - of course it is aggravating
that it only does it from a very 'cold' start.....

I have checked the audio circuitry per Steve - and couldn't find
anything BUT - it ONLY squeals IF there is a module inserted - sounds
like feedback - does it with all modules - new ideas please?

Thanks

Try it with a 50ohm dummy load and let us know what
happens.

you fixed it ! thanks Mike

72 John VE3NFK -

now as I wrote on the WRP-L group - I need to package it and the QBSA - I think I might use the Altoids again - and either use a present box; or build a new one .. I'd just like to make it an easy switch over.... my son suggests that - and a little wooden frame to hold them together.

722. new Bands for ATS3 - the second

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-01-07 15:48:10 UTC
From: Lutz Bergner
Topic: 708 Message: 722

Hi all,

just worked John - K2VV in MO on 17m with my ATS-3 7 Band Tcvr. :-))
It works definitely. Some things I learned on the way I'd like to share with you.

- Steve is right! :-) It's mandatory to replace the 74HC02 Driver by an 74AC02. The HC02 produces lots of Heat and a totally damaged signal spectrum at least on 15m.

- During my simulations of TX output- network I estimated the optimal load of the 3 paralleled FETs to be 5 Ohms. That seemed to be right. Got 3,4W out on 17m. On 15m I did not dare to use the optimal network because there would be a considerable amount of dissipation at this high frequency with no cooling surfaces. (with the 2N7000). Used kind of Steves compromise dimensioning and got 2.5W out there.

- Fortunately I had no raspy sidetone and other disadvantages so far. Think the 60MHz reference is a good compromise indeed. RX current consumption on 17m is 37,5 mA. I am happy with it. IMHO one should not go even further with this layout and schematic.

- Did merge in all fixes to the old version of Steves Firmware with the "altband" feature included. Now it is equivalent to the 02-20-06 release. All my modifications are commented. Though it's not much : 9996KHz (RWM) calibration for EU, 60MHz refclock, additional bands enabled, swapped paddles (not included) .
One little thing is still left to do - 17m puts out a "ATS-1" like 160m instead of "ATS-7". Steves permition provided I will put the commented source together with schemas and photos into my gallery.

Nevermind - I see it adds 160/17/15m - by the way, just for clarification - this mod is for the ATS3 or is it the ATS3A ??
Hopefully we will see some additional band module boards/parts kits or perhaps Steve will kit some after he completes testing.

Congratulations, Lutz!

AS I mentioned; I haven't yet built my second ATS-3 - so from this posting; I take it I need to change to the 74AC02 and a 60 mhz oscillator for the main board? I am just trying to collect the appropriate parts before I start!

Hi John,

my ATS3 was heavily modified before and has all features of the ATS3A
without missing the wideband IF. So it would not make a big difference
though I could not know the impact of the slightly different layout of
both versions.
Here's what you had to do except of all unsoldering - of course :
- Go to Mike's W1MT webpage and get all things/hints you would need for
loading a different firmware. It's very easy and works great. You may
download my version as soon I managed to ask Steve for permission.
- Get a 60MHz SMD 3.5V Crystaloszillator in 5 x 7 mm size. (e.g.
Farnell) ,a 74AC02, NPO Chip- Cs and Toroids. Unsoldering of the old
40/50MHz Oszillator is not easy. I used two soldertips together - one in
each hand.
-Spurfilter:
Remove C38,C39,C40 and replace them with new values.
c38=47p
c39=82p
c40=47p + 6p8
c41= C41 + 4p7
c42= C42 + 2p2
- Make some bandmodules for the new bands.....
give me a week or so to make the artwork ready to publish. If you 'd
prefer to build up an original ATS3 I could simulate ATS3-style
bandmodules for you as well . This would be quickly done with RFSIM99
(google for it - it's great!)and all the lessons I 've learned. My
modules rather fit into ATS3A except the pin layout.
- Load up the new firmware.
- Have lots of fun..

Anyway it worked for me . Cannot _garantee_ that it will work for others
in all circumstances.

Hi Lutz...

Thanks very much - I am in the nice position of having a complete
ATS3 (not A) unassembled - so I can put the right (your!) parts in
first time - I have added the ocs and 74ac02 to my parts order; and
will add the caps as well -- I have a bunch of toroids ..

I will very much appreciate band modules that will plug into the ATS-3
- I am not going to worry about 160 - but would like 15/17.
And I am prepared to update the firmware - I have the 'fixings' - just
haven't tried it yet.

The RFSim looks very interesting - but I am more an 'assembler' than a
tech....

Thanks again

Hi Lutz,

Thanks much for the info. I've got a built ATS-3 and an ATS-3A is on its way, so I have the option of doing either. I suspect if you are going to do artwork for the ATS-3A modules, then that is the route I will take - plus it keeps my ATS-3 working while the ATS-3A will be on the bench.

Hi, Your work is very interesting but I hve a question about the SW fixes you have reimplemented. One SW fix handles an audio bump at the end of every character. I am using the ATS3 a lot for contesting and sometimes I have the rig hooked up to my computer and working in straight key mode. I assume the fix for this audio hump is included in your version.

Keep up the good work

Hi Anders,

Here's what I did exactly. I took the firmware version 27.MAR.06 from the W1MT webpage and made a "diff" against the version with the altband feature which is older. Then I manually merged in Steves fixes which I extracted with the diff command (on my Linux PC - diff is a Linux command to compare textfiles). I then changed the reference calibration to the frequency of RWM 9996KHz which is better for us Europeans and the bandmessage for 17m to "ATS-7". Thats all.
Steves straight key fix should already be included. One important thing. This version is not ATS3A aware but somebody who needs it could easily incorporate the altband feature into a recent ATS3A aware version.

Well, I built mine with ATS-3A, docking station, NESCAF filter and T-match tuner into one enclosure. Actually, I made a custom panel 7" X 7.5 inches, to mount in a waterproof Pelican case, with storage remaining for phones, key, battery and even antenna. I wanted a waterproof enclosure to take on the boat. I will post pictures in a few days.

From: Andrew C. MacAllister
Topic: 740 Message: 740

My first ATS-3 was finished in November, 2004. I have since built the ATS-3A, and went for lighter weight. Connectors have been removed, smaller and fewer Li-Po batteries were used, and the housing is primarily balsa wood. The key paddle is 1/32" plywood, but I had to have two earbuds. The new rig weighs in at 1.9 oz including earbuds, batteries and paddle. The two batteries are 200 maH units from batteriesamerica. They will last for the two-hour Spartan Sprint and run about 8V for 3W out. Check out my photos in the W5ACM folder.

Good luck, Jeff. I hope you have a good head mounted magnifier. Don't laugh, but I have one of those cheap Radio Shack "microscopes" and found it handy for checking some of the smaller pads.

SMT is not that hard and I found it to be kind of fun.

Well, after purchasing my ATS-3 in July of 2005 ... it looks like the big day has come.

Today looks to be the day that I start to melt solder!

I got a nice new temperature controlled solder station for Christmas, with a couple small tips, so I have no more excuses.

Hopefully all goes well and the next time you hear from me will be on the air!

I just received my ATS-3A kit. Have never been much of an altoids enthusiast although have used them sometimes. Like the LMB CR line of enclosures. However, the controls for the ATS are evidently tiny pushbuttons mounted onto the PCB, maybe the altoids tin is the only thing that will work.

Has anyone successfully installed the ATS-3A in a more conventional aluminum enclosure? Any suggestions or tips would be appreciated.

I don't know why you couldn't. You could use panel mount push buttons on short leads on the front panel. You might still end up with the ant., paddle and phone jack on the sides. You should be able to put the power input wherever you want (mine is on a pigtail with powerpole connectors). It wouldn't be quite as compact as the 'toids tin, but would still be a mighty small radio.

Those tactile switches in the 3A are the shortest
ones. Just get some longer and you can use almost
thickness sized box. If you've seen an ATS2 it uses
the same style switch just longer. Mouser carries them
(probably Digikey too) look under tactile switches.

Curt,

I mounted my first ATS-3 in an Altoids. I'm building a second unit that will have a frequency readout as well as a tuner so I'm planning on mounting it in a Bud econobox:

<http://www.budind.com/view.php?part=ec-box>

I plan on building the board without the switches, power connector and phone jack and mount this components directly on the Bud box along with the frequency display and tuner switch and capacitor(s).

I like these Bud econoboses because they are rugged, lightweight and have rounded corners so they
can be thrown into a backpack with fear of ripping the fabric.

I haven't decided on the size of the box because I have to figure out how much real estate I'll need for
the controls.

73,

Mike N2MS

Well, I screwed up and got the 74HC02 in my ATS-3A in backwards! Removed it successfully, in that I didn't damage the board. I figured as long as I was at it, I would replace it with a 74AC02, in case I want to add the higher bands later on. Looking at the data sheets, this SHOULD be a straight replacement, right? I HATE surprises. Bad enough I can't find pin 1 on these newfangled little bugs any more....(grumble,grumble).

Hi John,

It is a straight replacement and works very well. I already use it for abt. 1 week. slightly more power on the upper bands and 17/15 you could not do without replacing it.
If you can read the characters on the surface of the chip , you should find a little point in the lower left corner. This is pin 1. It's a bit dependant on the manufacturer.

From: pipesanddrums17
Topic: 762 Message: 762

I have just recieved the 3A kit from Steve. I have read some postings on adding 17 & 15 meters.. Before I begin construction is there someplace where ALL the Mods necessary to do this are documented? OR is there something in the works from Steve where these mods might be forthcoming as a kit?
I really do not want to start this project and then have to tear it apart...I would rather do it once
Should I just go ahead NOW and repalce the 74HC02 with the 74AC02 as a start??
I am looking for some insight here.
Thanks

Hi John,

tomorrow I think , will I have the time to do some documentation. Will supply data for a set of ATS3 and ATS3A style Bandmodules either based on RFSIM99 (google it) simulations. But these proved to be very precice for me in the past so you could rely on safely.
Generally - until now these mods have been done for my modified ATS3 only. It should not be a problem to do it for the '3A too but it has not been done yet.
According to these mods the following things had to be done:
- Merging in the "alternate band code" and 60MHz changes into a recent copy of Steves ATS3A firmware. The version I did use (contained in the files section of this group)is not ATS3A aware!
- Loading the new firmware.
- a 60MHz SMD oscillator 5x7mm 3,5V (e.g. from Farnell) instead of the 50MHz one.
- a 74AC02 for the PA- driver
- new values for C34 - C38 (spurfilter - will be documented soon).
- build up new bandmodules for 160m/17m/15m.
Will be going to load up all doc to the filesection of this group hopefully tomorrow. These modifications are not supported by Steve. It works great for me - but obviously can't give any garantees.
By the way - 160m is a great band at the moment and I have much fun there with my ATS3. But in your big country this could well be another story.

Installed the 74AC02 today, and the ATS-3A is working! Been thinking and I would REALLY like to have 15M for it. Since I already have the 74AC02 installed, and I have the cable on order to program the thing, so the questions that arise are:

1. Part # and source on the 60 Mhz oscillator?
2. Any chance of Steve or someone making the blank band filter boards available?

Thanks,

NO, not me. Be advised I have NO spare filter boards and the cost of making some for the few who might want them would be absurd. Its not going to happen.

Subject: Re: [AT_Sprint] New bands for ATS 3A

Hi John,

tomorrow I think , will I have the time to do some documentation. Will supply data for a set of ATS3 and ATS3A style Bandmodules either based on RFSIM99 (google it) simulations. But these proved to be very precice for me in the past so you could rely on safely.
Generally - until now these mods have been done for my modified ATS3 only. It should not be a problem to do it for the '3A too but it has not been done yet.
According to these mods the following things had to be done:
- Merging in the "alternate band code" and 60MHz changes into a recent copy of Steves ATS3A firmware. The version I did use (contained in the files section of this group)is not ATS3A aware!
- Loading the new firmware.
- a 60MHz SMD oscillator 5x7mm 3,5V (e.g. from Farnell) instead of the 50MHz one.
- a 74AC02 for the PA- driver
- new values for C34 - C38 (spurfilter - will be documented soon).
- build up new bandmodules for 160m/17m/15m.
Will be going to load up all doc to the filesection of this group hopefully tomorrow. These modifications are not supported by Steve. It works great for me - but obviously can't give any garantees.
By the way - 160m is a great band at the moment and I have much fun there with my ATS3. But in your big country this could well be another story.

Dear asfco and others,

I'm 71 years old and 6 feet 4 inches big and I put together an AT-Sprint 3 kit and with some serious trouble shooting Steve and I got it working, in a Altoids tin. I have checked into the SSB net I belong to with CW from this radio on 3.939 MHz. I was amazed how many guys copy code and heard my 2.5 Watts since I was in CO and they were in NM. I of course copied their SSB with no real problem. I put in 3.939 in CW and the radio shifted near the right frequency but not exactly. Steve and I talked about this and know why.

I understand the fun your having with trying to add 17 and 15 meters. But even for a bet I will not change a thing on MY ATS-3! It's a fine 4 band radio and a kit I built. It was so much more for the money it was really cheap. There are people paying more for 4 single frequency radios and putting them in one box.

You should all know that the 2 new pc boards for 17 and 15 Meters will be hard to get. Steve said as much today. So these new bands are a MAJOR change to the ATS-3 and require 2 more filter pc boards and a lot of components.

Good luck to all of you and I will not read any more about this modification since it isn't for me.

Hi all ,

This is my last posting regarding this matter. I do not want to bother someone. Just uploaded the PDF File with some BM- data for ATS3 and ATS3A. Will not be going to modify the firmware for ATS3A myself because I cannot test it. Please be warned , This is a MAJOR modification. I do have much fun with it and it works great for me but I simply wanted to share these things and nothing more.
I personally find it not too difficult to etch and drill bandmodules by myself . Next time I will make myself a new BM for 30m to have 3 sections of filtering and thus beeing able to use a better impedance match to the ne602. But this is only interesting for Europeans probably and will not be published here.

Lutz,

Please keep up the good work. I appreciate all the
work you have done and enjoy reading about it. One
day I will mod my ATS rigs for 15M and maybe even
higher with the right oscillator. I think pushing the
edges of technology is what ham'ming is all about and
it is what this list is all about.

If anyone wants to use my version of firmware to
support extra bands I will be happy to provide support
via private communications....

PLEASE, do not stop with the mod info. I thought that type of thing was the
whole purpose of this list. Don't let one old Luddite stop you from passing on
the info. I am seriously considering trying this. I wonder if someone has tried
the ATS-3A with stock 50 Mhz oscillator? Might be borderline, but better than
the 40 Mhz one in the straight ATS-3.

Anyway, keep us posted!

Hi Lutz,

If you would like an ATS-3a to experiment with, I would gladly send
you my unbuilt kit to use as a guinea pig. I know this is probably a
sneaky way to get an ATS-3a built with 3 extra bands, but I also see it
as a way to provide resources so the experts can provide modification
info to other builder/owners. What are your thoughts?

Great idea John,
especially for those who hesitate to unsolder the 40/50MHz oscillator.
Its so tricky...
18MHz has the same ratio to 50MHz as 14MHz has to 40MHz. It is bleeding
edge indeed but should be possible. 15m is considered not serious with
50MHz and should be avoided.
As it may be so interesting for some - here comes a new spurfilter for
ATS3A - 50MHz refclock. It should permit 160m and 17m then.
C34=47p, C36=82p, C38=39p, C35=8p + 6p8, C37=8p + 8p2
It has a deep notch near the worst spur: 31928KHz. The AD spurcalculator
is invaluable indeed.

Hi Lutz,

Here you mention spurfilters. Is this common practice for DDS VFO rig developers to add a number of spur filters and why some DDS rigs may have many more noticable noises than others especially under poor band conditions?

Hi Pete

this is more a matter of a good design of supply voltages and grounding
layout. You will find a very carefull design at the ATS devices giving
VERY few noticable spurs. Normally each DDS vfo needs one spurfilter
especially to keep away images and combinations of reference- with
desired frequency.
it should pass all wanted frequencies and is mostly a low pass. In the
original design it passes frq. upto 15MHz. This would be too low for 17m
TX signal. Thats why I did supply a new one which has a deep notch at
the first unwanted frq. 31280KHz.

781. ATS-3 Computer Control Interface

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-01-15 21:18:02 UTC
From: Joe Rocci
Topic: 781 Message: 781

I've been noodling with the idea of a small board that would plug into the ATS-3's programming header and take control of the rig. It would do this by holding the ATS-3's microcontroller in reset, thus releasing it from the internal I/O bus and allowing another controller to drive the bus. The proposed interface board would have another microcontroller and a USB interface. The USB interface would provide 5V to the ATS-3 which would power everything except the transmitter. If I can figure out how to also implement a step-up switching regulator on the interface board without drowning the receiver in noise, then the USB port can probably also power the transmitter, at least to a watt or so. The interface controller would be programmed to communicate with a laptop or other PC via a virtual COM port driver in the PC looking like, say, COM1 to the PC. The controller would have a very simple application that would allow the PC to send high-level commands to the ATS-3 such as various frequency control mechanisms, mute, and TX enable.

If this works out, I'd have a nice USB-powered, software-controlled 'brick' that I could take out on my RV outings. With appropriate PC software, it should be possible to send/receive CW morse and a simple 'fuzzy' digital mode such as Hellschreiber from the PC interface.

Is there any wider interest in such a project?

Hmm.... Trying to think what I would get out of this, ecept requiring a PC to run the radio...

I suppose you could easily add memories that way. And a nice GUI with on-screen 'knobs' for RIT, etc.

For sheer efficiency, however- you can't beat the basic rig, with a set of paddles for freq entry, and the wetware between your ears for Morse decoding.

In any event, keep us posted as your musings evolve!

Thanks Bruce,

Since my intended application is mobility, not backpacking, my goals are a little different. I keep a compact laptop in my RV. That, together with this little Altoids 'brick' which would get its power from the laptop battery, would be very nice for me to set up on a table or even inside the RV, with no need for an external battery pack. And since the laptop's battery is pretty substantial and get's recharged as soon as I put it back in the RV, it's convenient for me. Also, as you pointed out, the sky's the limit when you get into software features and that appeals to me as I love to develop GUIs and applications such as this.

Once I get the ATS kit up and running, I'll probably begin development of the plug-in interface board. If anyone has suggestions for value-adds, I'd appreciate it.

Hmm.... Trying to think what I would get out of this, ecept requiring a PC to run the radio...

I suppose you could easily add memories that way. And a nice GUI with on-screen 'knobs' for RIT, etc.

For sheer efficiency, however- you can't beat the basic rig, with a set of paddles for freq entry, and the wetware between your ears for Morse decoding.

In any event, keep us posted as your musings evolve!

I love the little rig the way it is, but your idea looks like a very logical progression of development. I'll certainly follow your work with interest..

I wonder if Steve hadn't anticipated the many owner enhancements of his creation. The activity speaks very well of the value his original designs.

Thanks Bruce,

Since my intended application is mobility, not backpacking, my goals are a little different. I keep a compact laptop in my RV. That, together with this little Altoids 'brick' which would get its power from the laptop battery, would be very nice for me to set up on a table or even inside the RV, with no need for an external battery pack. And since the laptop's battery is pretty substantial and get's recharged as soon as I put it back in the RV, it's convenient for me. Also, as you pointed out, the sky's the limit when you get into software features and that appeals to me as I love to develop GUIs and applications such as this.

Interesting idea. Almost all the connections you need come out the programming port. The only one which doesn't is the Tx keying pin. I suppose that could be rewired to where pin 1 of the MPU goes now. Pin 1 is only needed for reprogramming the chip. Oh and side tone, but I guess the PC or what ever could generate that, but it wouldn't be routed through the headphones.

Good luck, I wish I could write programs which can run on a PC. Maybe some day I'll learn.

Steve,

For Tx control. I was going to play a trick with the MPU's TEST input. As far as I can determine, this input is used for programming, and the major thing you have to be concerned about if you drive it for something else is that you might inadvertantly blow the programming fuse in the MPU. However, it takes several (5-7) volts and upwards of 100 ma to blow the fuse. Since the input looks otherwise like a 60K resistor inside the chip, I was planning to cut the line between the TEST input on the MPU and the TEST pin on the connector and insert a 10K resistor in series. Then I was going to connect the TEST pin on the connector to the TX enable line. This mod would allow the interface card to drive Tx enable without damaging the internal fuse. When the programmer is plugged into the connector, all should work as usual. It's only a theory at this point..Comments?

Joe,
I have been thinking about something a little different. The ATS-3 & -3A are essentially software defined radios. How about an approach that gives operators a 'user-friendly' software interface to take advantage of the potential for a 7-band radio? Of course, this assumes you have made the 60 MHz clock osc change and the related mods to permit the additional bands, and have the extra plug-in boards you need.

Before an operating session, you would launch a file on your computer to re-program the radio for your immediate preferences. The computer would display a list of menu options such as:
- Which 4 bands to use from the 7 bands available (160m - 15m)
- Specific frequency that the rig wakes up on at power-on for each band (maybe on 40m you prefer 7030 instead of 7040)
- Tuning step size (50 Hz, 100 Hz, etc)
- Code speed for audio prompts (Rx frequency, etc)
Once you have your preferences entered, the computer updates the firmware and you're ready to go.

Any variable that is stored in the MPU firmware could be changed to suit individual user preferences. Of course this all could be used on a stock rig, just minus the extra bands.

I did W1MT's firmware update on my ATS-3, and know that the update process is relatively quick.

Hi Mike!

Your idea is interesting, but I disagree that the ATS3s are 'software-defined radios' (SDR). They're 'software (more accurately 'firmware') controlled radios' but that's a far cry from SDR. SDR does all the IF filtering, demodulation, and other processing in software, eliminating the need for complex and fixed hardware. With SDR, there are no crystal filters, BFO's, product detectors, and most of the other blocks you'd find in a receiver IF. It's all done with digital signal processing.

Some of the other features you mentioned don't need an external computer. With a minor firmware mod, the existing ATS3 could possibly remember the last frequency it was operated on for each band, so as soon as you plug in a band module, it would automatically tune to that frequency. Same goes for tuning step and code speed. I'd have to look and see if there's enough non-volatile memory available for this though. Steve or Mike could probably tell us off the top of their heads. Even if more memory is required, it might be done with a drop-in upgrade to one of the higher-end parts in the existing microcontroller family, or even with an external serial-loaded flash memory. The memory upgrade could easily be done with a small board that plugs into the programming header, and some simple firmware mods to the ATS firmware.

All this is cool and someone should do it. In fact, someone probably will do it now that you've suggested it. However it doesn't meet my needs for a teeny radio that's powered from my laptop's USB port, and which I can control from the laptop.

In my version the flash is full. In fact, for the last mod I made I had to steal keyer memory to be able to store the menu/band info structures in flash. (This version is not released because it really does not add any new functionality to the rigs. It freed up some program space, 600+ bytes, for the future. Maybe one day I will come up with something worthy for a new release but for now I am pretty content with how the rig works. I am percolating on the multiple band stuff - perhaps can come up with some thing in that arena.)

The thing about having the rig "remember" the last freqs used is that your brain now has to remember too. It was a deliberate decision to always come up on standard freqs. That being said there is nothing stopping anyone from customizing their rig to their hearts content. :)

The flash is already there for the tuning steps, just add code to allow changing it.

Lots of neat ideas floating on the list lately. Glad to see the interest!

792. ATS-3 to Laptop

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-01-18 01:17:30 UTC
From: Tim Keene
Topic: 792 Message: 792

For me, I would not need to key the rig with the computer. I tend to be old fashion and think that one should send code with the traditional devices, - straight key, bug or paddles. I always thought sending (or receiving)morse with a keyboard/computer was not really code.
Of course, a Tx line would have to be installed in order to put the rig in the tune-up mode for tuning the antenna tuner.
I would most certainly use the laptop with the ATS-3. Really cool Idea.
That's my 2 cents worth
Tim - K5DEZ

I agree with you Tom. My latest approach to this preserves all the functionality of the existing microcontroller while the interface is plugged in. I think with some simple ATS firmware mods, the microcontroller can know when the interface is plugged in and behave compatibly with it so that the computer just adds value instead of eliminating features. I bought a TI development tool today (only $20) and downloaded the firmware development environment. Looks like a very clean, simple, and understandable instruction set. I'm annxious to get started.

The Pelican case is 10" X 9" X 5" deep. The panel on the rig is 7" X 7.5". There is plenty of storage room left in the bottom os the case for stuff, as I noted. I didn't care about "Spartan Sprint" but wanted waterproof, all-in-on-box rig to take out on the boat.

Just did the 40M modules for the "Kitchensink" aka ATS3A. Now with 10.9V from the BSA regulator I get 5.4W on 20M, 4.7W on 80M but only 2.2W on 40M, after diddling with the turns spacing on LF1. Is lower output typical with the 40M module? Haven't done the 30M one yet. 2 40T toroids are enough for one day!

Hi John No. The usual is 80 40 30 are fine but 20 is a little low. I
think you may have the wrong value of capacitor on the 40 filter board.
But who am I to talk, I only have 8 surface mount resistors mounted so
far, on my Base unit.

From: Rob May
Topic: 800 Message: 803

John,
My ATS-3A is also low on power on 40M, but not terribly so. About 25% less
than the other bands. If you look in the files section of this Yahoo group,
you'll find modifications for the 40M band filter. I haven't had time to
try them yet.

This Sunday evening, the Flying Pigs Amateur Radio Club International will be holding its monthly Run For The Bacon. This is a friendly, two hour QRP CW Sprint, which is open to ALL radio amateurs, will last from 9:00 - 11:00PM EST (0200-0400 UTC Monday).

You may work stations once per band on 160, 80, 40, 20, 15 or 10 Meters. Suggested starting frequencies are 1.812, 3.562, 7.044, 14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs membership number. If you're not a member of the Flying Pigs, and would like to be; then please click on the "membership" hyperlink on .http://www.gentzow.com/fpqrp/ Otherwise, non-members can just use their output power figure.

You can report your score via the Autolog page which can be found at :
http://gentzow.com/fpqrp/autolog.asp
or you can mail your logs to the address given on the Autolog page. The deadline for logs is January 27th at 2400 UTC.

Hope to catch you on the air Sunday evening!

I purchased one of the last ATS3As from Steve's last run, received it two weeks ago. Have second thoughts about building this kit because have more QRP rigs than can keep up with. The kit is in it's unopened bag. Selling for my cost, $165 + priority mail + insurance + confirmation. Paypal or USPS Money Order for $175, and your address (CONUS only please).

Thought this had sold earlier, but money never sent and my email queries aren't being answered anymore, guess the person changed his mind. First person sending $ gets the kit.

Well, I went back and read the archives, and went ahead and did the whole fix.
Added a turn to L1 and L2, and changed C2 from 100pf to 83pf. Brought the power
at 10.9V up to 4.75 on 40M. Not as high as 30 or 20, but plenty good enough.
Receiver in the ATS-3A seems much hotter than the ATS-3. Great little rig!

I'm gonna answer my own question here, as I just looked up the IC. Looks like it was designed to drive 8ohm loads, so lower impedance phones means more power output. Gotta get me some low-z ear buds.

Thanks

For the time being, I made a resistor mod in the output stage that raises the gain about 8dB, but it's still lower than I'd like in my headphones, leading me to believe it was designed for lower impedance. When I get more time, I'll look up the amplifier IC and determine if it can drive low impedance loads.

100pF is only a rule of thumb. If you are sure about not having mixed up the capacitor values and have counted turns in the inner of the toroids , you could play a bit with L1F and C2F. These two have most influence to the match of the PA to the LP Filter. First try squeezing/expanding the turns of L1 a bit. If it doesn't help - try 1 turn less or more. Try to find out the trend by testing power at the band ends.

I wonder how many he does in a run? Judging by the growing popularity,
he probably could get away with a larger run. I expect he has to order
"X" number of boards. Order too many and he's stuck with the leftovers.
Too few and it just gets people salvating for his next project. :-)

Which stage are you looking at? The first stage is set
up as low pass (can't remember the target freq
offhand), the middle (panasonic agc chip) is broad
band and the last stage is set up at 600hz bandpass.
Pretty standard op amp configurations (I have run the
calcs to confirm and it seems to be correct in
operation), so not sure why spice is giving up
something different???

Steve's firmware gives you a 585Hz sidetone, maybe
that will help you decide where you might want to go.

Jim,

I got mine running over the weekend, with one band module built up (20M) . Been testing the receiver with a signal generator and comparing to Spice analysis. A couple of observations so far:

1) The audio output level is a little low for my headphones. Lowering R8 from 113K to about 27K raised the level enough for me.
2) The Spice predicted bandwidth of the 20M band filter seems wider than it needs to be, and it looks like an additional few db of gain might be available by optimizing the impedance match into the mixer. I'll report as I work through it.
3) In spite of what the manual says, Spice analysis indicates the audio bandpass is centered at 400 hz. I'll confirm with test equip later.

As I go through the unit with a fine tooth comb, I keep looking for ways I would have done things 'better', but it looks like Steve has really thought this through and optimized if for the most performance possible in the space it occupies and the power it consumes. There are a few tweaks that can be performed, but nothing that's going to make a dramatic improvement. Nice job Steve!

Good luck bringing your unit up Jim.

Joe,

I simulated the filter somtime in the past using TINA SPICE. My simulation results indicated a center frequency of 600Hz (596Hz) and a -3dB bandwidth of about 120Hz. For my ATS-3A, I opted to make the component substitutions and built a 1.8kHz low-pass filter. So I've never really heard one with the usual narrow AF bandpass. My thought was I didn't need both a narrow IF filter and a narrow AF filter and I've been happy with the AF low-pass sound. Though I am curious whether anyone has anyone tried both of them?

I'm refering to the output stage (I think that's what I already said). Spice analysis indicates it's precisely centered at 400 Hz. I'll check with the signal generator later today if I get a chance.

Which stage are you looking at? The first stage is set
up as low pass (can't remember the target freq
offhand), the middle (panasonic agc chip) is broad
band and the last stage is set up at 600hz bandpass.
Pretty standard op amp configurations (I have run the
calcs to confirm and it seems to be correct in
operation), so not sure why spice is giving up
something different???

Steve's firmware gives you a 585Hz sidetone, maybe
that will help you decide where you might want to go.

I had a blast with my ATS-3A last night on the Flying Pigs Run for The Bacon Sprint. It would have been nice if a few more piggies had participated though.

One thing I always wonder about - is the sidetone supposed to be the same as the received CW audio frequency? It would be appropriate that the center of the audio passband match the sidetone - true?

The audio out on my ATS-3A seems better than my ATS-3. Strong signals and high noise actually "hurt" the ears. I had to strain a bit on the ATS-3, even with a similar resistor mod. I also use the most sensitive and lightest earbuds I can find. The current choice are white Koss units with molding cones that go in the ear canal. They are in my rig pix in the photos section under W5ACM.

Subject: Re: [AT_Sprint] ATS-3 Audio Bandpass

Jim,

I got mine running over the weekend, with one band module built up (20M) . Been testing the receiver with a signal generator and comparing to Spice analysis. A couple of observations so far:

1) The audio output level is a little low for my headphones. Lowering R8 from 113K to about 27K raised the level enough for me.

2) The Spice predicted bandwidth of the 20M band filter seems wider than it needs to be, and it looks like an additional few db of gain might be available by optimizing the impedance match into the mixer. I'll report as I work through it.

3) In spite of what the manual says, Spice analysis indicates the audio bandpass is centered at 400 hz. I'll confirm with test equip later.

As I go through the unit with a fine tooth comb, I keep looking for ways I would have done things 'better', but it looks like Steve has really thought this through and optimized if for the most performance possible in the space it occupies and the power it consumes. There are a few tweaks that can be performed, but nothing that's going to make a dramatic improvement. Nice job Steve!

Good luck bringing your unit up Jim.

Joe

Can someone tell me what the optimum impedance is for a headset to be used with the ATS-3? I't might be staring me in the face in the manual, but darn if I could find it. I've been using what must be high impedance earbuds from my MP3 player, but the volume seems pretty low. Maybe it's designed for a lower impedance load?

Depends on how you adjust calibrate the rig. I like
the sidetone to match the offset so that I can zero
beat signals, so I calibrate so that this is true. Not
all calibration procedures will lead you to this
configuration.

Hi Gang, your talking about the frequency the passband is tuned to.
This has a lot to do with the frequency of the BFO, which you move to a
frequency away from zero beat to one you like. You do this when your
tuning up the rig after building it and debugging errors.

If you don't like what it is now change it!

Tom,

I just ran the Spice simulation again to be triply sure my eyes aren't playing tricks on me - it says 400 hz on the dot, and it's about 200 Hz wide at the -6 dB points. Maybe your unit is different? For comparison purposes, here are the component values on my schematic:
R10 = 267K
R9 = 2.74K
R8 = 133K
C23 = .01uf
C22 = .01uf

I'm using a generic op-amp in the model, as I don't have a Spice model for the LM4808, but I doubt that's making any difference at a few hundred hz.

Joe,

I simulated the filter somtime in the past using TINA SPICE. My simulation results indicated a center frequency of 600Hz (596Hz) and a -3dB bandwidth of about 120Hz. For my ATS-3A, I opted to make the component substitutions and built a 1.8kHz low-pass filter. So I've never really heard one with the usual narrow AF bandpass. My thought was I didn't need both a narrow IF filter and a narrow AF filter and I've been happy with the AF low-pass sound. Though I am curious whether anyone has anyone tried both of them?

Components look right on. I run spice "manually" by using the standard formulas. Look here for an example: < http://www.swarthmore.edu/NatSci/echeeve1/Ref/FilterBkgrnd/Filters.html >

I get 594Hz.

Only thing I can think of is perhaps the layout you are simulating might not match the ATS3A schematic?

Btw, I modified one of my rigs to be low pass at this stage and left another stock. If the bands are crowded (contest) I'll use the stock rig otherwise I use the modified rig.

Mike,

Thanks for the reply.

This is a weird one! I have now found that, contrary to my earlier belief, the simulation IS very highly dependent on the Spice model chosen for the amplifier chip. With different amps (all with GBW's well, well,well (that's akin to 3 orders or magnitude) above the center freq), I can get responses that peak anywhere from 200 to 600 Hz. This will surely keep me awake tonight

Joe,

The gain-bandwith of the op-amp indeed affects the filter characteristics. Recently, I did some analysis of the affect of op-amp gain-bandwidth (GBW) on active bandpass filter performance in a low voltage gain. The most sensitive bandpass filter parameter to GBW was the filter center frequency. And then to a lesser extent the gain and bandwidth characteristics. An ideal op-amp will provide perfect performance, but an op-amp with too low of GBW for the application will move the center frequency way down. This is a generalization.

Thomas,

Well, that was my suspicion about what's going on with the simulation, so to confirm it I put in an op-amp that has user-definable parameters. When the gain-bandwidth was lowered significantly (far lower than any of the modern op-amp models should be), it did change the center frequency and distort the shape. What I'm seeing, however, seems to defy everyhing I know about this stuff and make me wonder if there's something wrong with the op-amp model libraries I'm using. The Spice version is called Catena by a UK firm called Simetrix. Tomorrow I'm going to try another Spice variant and see what happens. Bottom line, though, is that the stage does have a measured center frequency of very close to 600 Hz despite what Catena Spice says.

Pete -

Thanks. I was a little nervous to put drill to box, so I practiced the old carpenter's adage, "Measure 3 times, drill once!"

I started by drilling small pilot holes to check for proper location, then finished the holes with a Unibit. It worked really well on this aluminum billet material.

One place that needed special attention was where a corner of the board meets the corner of the box. I posted a new photo to help ease the verbal explanation. I don't know what the machinist guys call them, but Doug had to leave small columns of material in two diagonally opposite corners of the box to provide a place to tap holes for the screws to secure the lid. The Altoids box has no such issue. I used a moto tool with a small grinding stone to take out enough material so I could get the board where I wanted it, snugged up against the end of the box.

Could be my imagination, but the radio seems to get better signal reports now!

Charlie (ke2sp),
Very good. I am interested. What are you asking for it? Did you
install it in an Altoids container and use the templets that are in the
manual? Do you have a picture of it in the case? I have an interest in
operating 40 meters. Have you built and tested that tank circuit also?
What kind of rig is that you have in the picture of you on QRZ.com?

From: Richard
Topic: 847 Message: 847

Folks,

I've been working on my ATS-IIIa. It has been a lot of fun. I fired it up and was running through the initial alignment and checks and ran into problems.

I got to the LO offset trim calibration step and found I had no audio.

I am a little limited on test equipment. I do have a friend across town who can help me but I thought I would do what checking I could before I got him involved.

I can see a signal from the reference oscillator if I tune to 50 Mhz on my FT-897D. I am also getting the 1.7V to pin eight of the DDS chip. So I assume that means my reference oscillator is fine.

I went through the voltage checks on the DDS chip.

This is using a digital volt meter with a standard probe (not rf probe). I assume this is correct.

All pins read correct voltages except the following.

Pins 1, 2, 17, 19, 20 all read zero volts.
Pin 3 reads -69 mv.
Pin 16 reads 6 mv.

Also, the voltages at pins 14 and 15 are reading 3.5 volts instead of 3.3 volts. Is this normal?

So, I'm thinking I have a bad DDS chip. Maybe I zapped it with static electricity.

Any thoughts or suggestions?

Richard,

I assume that the MSP430 microcontroller is alive. This is confirmed if the ATS-3A starts up by sending the morse startup message in the headphones. If it appears alive, you can test the DDS by using a general coverage station receiver. Put the ATS-3A near the station receiver receiver and connect a short ("12" or so) wire pickup antenna to the station receiver. Tune the station receiver to the ATS-3A default local oscillator frequency (Flo = Frf - Fif = 14.060-4.915 = 9.145). Turn on the ATS-3A with no band modules connected. The ATS-3a will start up with the DDS generating a constant carrier at about 9.145 MHz. As you push the + & - frequency buttons, the frequency of the DDS should change in the station receiver.

If the micro is alive and there is no output from the DDS, it could be that there is a short or open in one of the 3 circuit traces from the MSP430 micro to the DDS.There could also be a solder bridge under either the DDS or the micro.

I doubt if the chip is blown unless you did something horrible - you'd know if you did. If you destroyed it, you would have had to overvoltage it or possibly put it in backwards., or something else that would make you say dooooh! I doubt if static zapped it.

Joe,

Thanks for the reply! No joy on 9.145 Mhz. I didn't hear a thing. I'm double checking all of my solder connections around the microprocessor and the DDS. I hope it is something simple.

851. QBSA jerky frequency display on high bands

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-01-27 22:24:23 UTC
From: Steven Weber
Topic: 847 Message: 851

I finally got a chance to check out the QBSA display update problem.

Turns out if the input frequency to the counter is greater than 6.5532 MHz, the display doesn't always update as quick as it should. 6.5532 MHz is the point where the 16 bit frequency counter overflows and interupts have to be counted. If the counter interupt happens to happen when its checking the A/D converter to see if there is transmit power, it can get corrupted results and think there is power output and freeze the display when it shouldn't.

In thoery, this shouldn't have been a problem and I don't know why it happens. Which is why I didn't notice the problem. The power detect was the last thing I did to the program and at the time I was only concerned that it worked and didn't notice it was affecting the frequency display in a way that it shouldn't.

In anyevent, I figured out a solution - turn off the interupts when it checks the A/D converter count, then turn them back on. Glad that worked, because everything else I tried to fix the problem didn't!

So, if you want to have this problem fixed, send me the MEGA48 chip to reprogram. I'll keep the EEPROM data intact so you won't have to do another re-cal. I'll pay for return postage.

It seems there's a little bit of Murphy in everything we do...

Hi Richard,

Have you checked U7 (AD9834) carefully? I hate to admit this in public, but if U7 in mounted backwards, then your exact symptoms will result (don't ask me how I know :-)). I also happen to know that mounting it backwards will not destroy it (amazing, huh?).

The microprocessor will check out OK but the LO will not if there is a problem with this IC.

Maybe this will help...

Mike N5JKY
OK City

BTW, yes, mine is working fine now... 80M and 20M modules have been made so only 2 more to go before FYBO.

Joe, John, Michael,

Thanks for your input. Joe, I looked for a long while trying to see any shorts or opens around the DDS chip with no luck at all.

I reheated the lines running between the microprocessor and the DDS chip. Still no difference.

So, I just reheated every pin on both the microprocessor and the DDS chip and yeah! I had a tone on the L.O. adjustment step. I also heard the 9.145Mhz signal on my FT-897D with no band module installed and I could adjust it up and down with the tuning buttons.

I have the 40m band module installed now and tuned. I'm listening to a station right now. I also tried transmitting into a dummy load and the transmitter works too.

Thanks for the assurances about the DDS chip. I was afraid I had zapped it. I was already trying to figure out how I would remove and replace it. I'm so glad I didn't have to.

So, many, many thanks for pointing me in the right direction.

73,

Richard

856. 100% ATS-3(a)

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-01-28 17:38:35 UTC
From: JT Croteau
Topic: 856 Message: 856

I'm curious if anyone finds themselves, or actually are, using their ATS-3 or -3a as their only rig? I just moved back to 1-land and consolidated a lot of stuff in the process and going to take a pure minimalist approach going forward.

At home I will be using an ATS-3 with W1MT's firmware, a ZM-2 tuner, and a random wire. As I also spend a lot of time outdoors, I'm also putting together a portable kit using an ALT tuner and a 51' wire. Both setups will be powered with 1000 mah Lithium-Polymer packs.

I've also decided to change to a 1-land call and submitted my vanity application yesterday. If no one beats me to it, there are no pending applications for it currently, my new call will be N1ESE.

But enough of my rambling, it's just a lazy Sunday here and I'm a bit bored as my ATS-3 is packed up to be mailed tomorrow to W1MT for flashing.

JT,

I have a few other unfinished projects in the oven almost ready to serve, and once I'm done with them, I was intending to make a little board that plugs into the ATS-3 programming header and powers the rig from a USB connection to a laptop or desktop computer. The idea would be to use a common rig control interface protocol such as the Elecraft K2 uses. With this, you'd get power for the rig from the USB (at least to about a watt or so), computer control of the frequency through the USB, and computer control of the audio level by looping the ATS's audio output into the computer's sound card input. This would also let you apply DSP audio filtering via the computer. Other mods that might accompany this could be to open up the crystal filter and audio bandwidth a little bit so that some digital modes could be copied, and possibly a QRP SSB transmitter to augment the simple CW transmitter in the ATS.

My vision is some sort of very small docking station that the ATS would slip into to form a tiny 'brick" that could be used in conjunction with a laptop in the field or with a desktop computer at home. Of course, you could always take the ATS out of the docking station when you want to do some minimalist radio on the trail.

James,
I just finished building an ATS-3A, and I ran some quick sensitivity tests with the 20M band module. Signals at 0.5uv are easily copied. I'll try to develop some numeric data when I get a chance.

Beware! If you install the link-coupled coils improperly, you'll take a big sensitivity loss, and your input bandwidth will be very broad. If you're experiencing sensitivity problems, take a look at these coils.

In fact, I am.
I used to have an FT-857d, but due to lack of time to operate, I sold it off and got out of the hobby for a while.
I built the ATS-3A w/ intent on it being my only rig. I just built a BLT tuner from scratch, and am ordering the kd1jv swr/power meter kit as well.

I've not had it very long and haven't been able to operate as much as I'd like. As of yet, I've still not had any QSO's on it. Last night I could faintly hear a w7 coming back to me, but was unable to copy anything else...
At this point I'm not real certain that my ATS is receiving very well on any band, either that or the bands have been weak.

But, I do look forward to exclusively using this rig.

Topic: 860 Message: 860

I have a new unbuilt ATS-3A kit. I want to ready it for 7 band opertation.

If I change the driver, reference clock, and spur filter, do I have to load the new frimware use the original bands?

Does anyone have a US source for the parts?

Does anyone have a source for new filter circuit boards and parts?

In the spur filter, I am confused by the capacitor values - C38=47p//6p8 C35=8p+4p7 C37=8p+2p2 ??

Any input will be appreciated. I want to get this right the first time.

As soon as you changed the reference clock, you would have to use the modified firmware. But you had to change the source by yourself because the published version is ATS-3 only - so far, because I do not have a ATS-3A. Of course you could use the original bands as before then . You just do not press the menu button at power-up. As soon as I have some time left I will be going to mod Mikes firmware for 7 Bands. Hope that MCU memory will allow it. I think I like some of its features and it's so well commented ;-) - Thanks Mike.

> Does anyone have a source for new filter circuit boards and parts?
>
You probably had to etch them by yourself at the moment or use scratchboard.

> In the spur filter, I am confused by the capacitor values -
> C38=47p//6p8 C35=8p+4p7 C37=8p+2p2 ??

Sorry, I hoped to make it clear. "//" and "+" means the same -> soldering in parallel on the back of the other. SMD chips can be stacked very cleanly. C35 and C37 have 8pF in Original. Simply stack a 4.7pF chip on C35 and a 2.2pF chip on the back of C37 and a 6.8pF chip on the back of C38. I probably should use another notation next time.

General notice:
The 7 band mods have not been tested on an original ATS-3A until now. There could well be (if not too likely) issues with T/R changeover noises on the higher bands. That could be cured - but I don't know.

Hi JT,

I 've been using it 100% for about one year now and am still happy.
Well - there are some monoband kit rigs - SST,Sparrow-17 (QRP-project),
GQ-40 (Hands) but no so called main_station_rig at all - and for one
year now they are all gathering dust.
It never gets boring... There is always a little feature or improvement
it could still have....though there are not many left.

I know I should have looked into this earlier, but finally got around to it today.

Turns out that when the input frequency to the counter exceeds 6,5536 MHz, the 16 bit counter overflows and an interupt has to be counted to get the full frequency count. When this happens, the update responce of the display becomes jerky.

Through the process of elimination, I discovered that its the A/D test to see if there is any power output and freeze the display is what is causing the problem.

For the life of me, I can't figure out what the interaction is. Maybe because there shouldn't be any. If there is a solution to this problem, its not going to be easy to find, but I'll keep trying!

This may sound feeble but I'm lost trying to order a choke I need.
I'm looking for a couple 47uH molded chokes. The kind that look like blue 1/4 watt resistors. I've installed them in numerous kits (Elecraft and etc.) over the years but never had to order a replacement. Looking at mouser or digikey is overwhelming with too many choices especially since I don't know how to ask (filter) for what I need. The choke will be used to block rf in the transmitter stage (final output power is about same as K2).

Can anyone offer some help here and maybe a suggestion for the best place to order?

Silly question Pete but, if you have seen them in Elecraft kits, have you tried contacting Elecraft? Elecraft is real good about stocking and selling components whether you've got an Elecraft rig or not.

Use Mouser's search engine. I searched for "47µH molded choke" and
quickly got:

http://www.mouser.com/search/ProductDetail.aspx?
R=9250-473virtualkey54200000virtualkey542-9250-473

from a list of 10 (most of which are not stocked or obsolete).
Probably this one will do...

Hello Pete,

Try starting here. This is Mouser's parts filter. I don't know what your current (amps) requirement is or I woul have filtered down to the part for you.

http://www.mouser.com/search/Refine.aspx?Ne=254016+1447464&Ntt=*inductor*&Ntx=mode+matchall&Ns=P_SField&Mkw=inductor&N=1323038%201525871&Ntk=Mouser_Wildcards

I went to mouser.com, and entered "47uh molded choke" in the search box. Got a few choices, but the one you want is part #542-9230-12 I think. Not terribly overwhelming for this old coot.

Hi

I built my ATS3 about 18 months ago and since then I have used it (99.7%)as my main rig, even participating in the IOTA contest (EU-135) and in the CQWW contest and several other local Swedish contests and field days. I am very happy with it and I am going to build an ATS 3a soon and I am following the discussion about 7 bands with a lot of interest.

I have tested to work the ATS3 with a rotary encoder and a simple interface to the up and down switches and I think that was an improvement. I am now designing an interface for an encoder combined with a simple keyer and a frequency counter. The keyer is needed as it is not possible to combine a straight key input (from my PC) with a pair of paddles.

In the end of the day, I love this rig.

Hi JT,

My Sprint 3 is the only HF rig that I have used in almost a year and
a half. The only other HF rig that I own is Small Wonder Labs SW
40, but haven't used it much since I put the Sprint on the air.

Been QRP only for the past 3 years and really enjoying it.

I recently built the Sprint 3 accessory kit and think it's great
addition to Sprint 3!

My antenna is a 120 ft wire up only 20 ft and an MFJ-16010 tuner. I
mostly use my old Radio Shack straight key from my novice days.

Nothing wrong with the minimalist approach ... it works great for me.

Hi all,

This is an answer to Petrs request to me off list. Very sorry abt the bandwidth but its just impossible to answer him. May be other Europeans are interested too.

Hi Petr,

according to my last experiences - forget about the MURATA 7.02. I do not useit anymore. Not that it would be bad, but a thoroughly tuned 2 section LC filter is far better. I could to believe it at first, but Peter DL2FI made same experiences with the K2 filters.
Take the following values. I made a new simulation for ATS3A.
L3: 22T 0.5mm magnet wire to T37-2. 1T link with thinner magnet wire. Regard the turn sense (sense?).
L4: 22T 0.5mm magnet wire to T37-2 with tap at 10T.
Wind carefully this thick wire can easely break the core. happened to me two times.
C5/C7= 220p//22p (//yellow trimmer)
C6=4.7p
Cut the trace from hot end of L4 to Pin 1 of the connector (RX in)
Connect the tap of L4 to Pin 1 instead.
-20dB BW of this filter is 400-500kHz depending a bit on Q factor of the real assembly.
You may have a spare MURATA 7.02 from me but....ASAP.

Here is a source for the SA612A:

Digikey part # 568-1204-5-ND
www.digikey.com

A jewelers loupe is the wrong tool for the job. A better tool is a headset magnifier.
Harbor Freight #38896-5VGA; $5.99
www.harborfreight.com

Also need fine-point jewelers tweezers; Harbor Freight also sells these.

When you solder the IC's, start by tinning one PCB corner pad with solder. Next, position the IC on the pads and solder to the corner pin. Fine-tune the position of the IC so that all the pads line up and then solder the opposite corner pin. Now mass-solder all the remaining pins with complete disregard for solder bridges. When you're finished, use solder-wick to wick all the solder off the top of the IC pins. Don't worry that you might have wicked too much off - it's not possible.

Hello Ken,

I just uploaded the circuit diagram for the encoder interface I used. The encoder shall be of the type with a resting position where both channels are off otherwise one of the outputs up or down will be active and thus there will be a continnous sweep.

In the circuit there are zero ohm resistors, they were added when I made an attempt to make a circuit board for the encoder interface.

The maximum tuning speed when the ATS3 reccognize single pulses is a little bit higher than the frequency sweep speed of the ATS3 itself. If the encoder is turned too quickly, the effective tunig speed will go down.

Good luck
Anders, SM5EFX

I'm in the check-out phase of building the AT Sprint 3A and not getting exactly what the manual calls out for the reading before L3 is installed.

The procedure on page 20 calls for a voltmeter to be connected between ground and the
Drain of Q4 then to send a string of Dah's while watching the voltmeter. Then the procedure says
the voltmeter should go near the DC supply voltage then slowly decay to zero when I stop sending the Dah's.

I'm using a BK 40 MHz scope to make the readings (I've also used a portable DVM and analog multimeter with similar results) and find that the unit will not start sending until I lift
the scope probe off the Drain of Q4. Once I lift the probe the Dah's start and I can put the probe back on the Drain of Q4 and see the scope trace is at the
supply voltage. When I stop sending the Dah's the Drain voltage decays to zero per procedure. I'm using a new 9 volt battery for the power supply.

Is this a good reading? Should the Dah's start with the scope/meter connected? Has anybody else had this situation?

I've checked all the components on the board for good connections and can't find any problems.

Thanks for your comment on this situation.

Regards,

Ted, W2TAG

Hi

I have still the 'squeal' - very loud - when I first power on the Sprint - WITH a good load ...
Any other ideas please... as it is I have to have the phones off - turn on the rig - turn off /on again to hear the startup..

thanks

John VE3NFK

PS -working lots of stations in the FYBO - a little too unpleasant outside tho' wind snow and COLD ...

John,
You seem to be the only one to ever have this problem. Send the rig back to
me and I'll try to figure out what its doing.

I am ready to assemble my ATS-3a kit, but I have been following the discussions on QRP-L regarding the various methods for soldering SMT components. I have assembled two small smt kits (including Steve's Rock Mite audio filter) with no difficulties. I simply placed and soldered each component, one at a time. Now some are suggesting that all of the smt components be mounted with small amounts of solder paste and then the entire pc board is placed in an oven or electric skillet. Gosh, I cringe just to think of it! Have any of you used these techniques? How did it go? If you did not use these techniques, why not?

Thanks and 73, Dave K1YHR.

I have built 7 ATS rigs using just a small tipped
soldering iron and real skinny solder. It works just
fine.

That said, if I had known that I would build that many
I would go with the method described at Cash Olson's
website:

Dave,

I built my ATS-3 the old fashioned way, one part at a time. I have seen the toaster oven technique demonstrated, but I don't think I would start on an ATS-3 with this method - I would pick something simpler and get comfortable with it.

Hi Dave, K1YHR

I've built an ATS2 and a 3 using a "doofus" hold down. It worked well for soldering with a small tip.. Here's the one I built.
http://www.wa0dx.org/wa0itp/accessories.html#doofus

I no longer solder smds with an iron, I use the electric skillet and heat gun methods with solder paste. They work great, and are rediculously easy... You might want to give them a try.
http://wb9ipa.qrpradio.com/smt/smt.htm
http://www.zianet.com/erg/SMT_Soldering.html

Cash Olsen has the solder paste in small quantities..

So now I'm "frying" one side and and "blow drying" the other .works great

Solder paste is overused for this, and can actually be problematic. If not cleaned thoroughly from under the parts, it can cause signal leakages and sometimes even corrosion and etching away of traces over time. I highly recomment against using it. Also, the heat immersion method can damage components unless the temperature rise & gradient is carefully controlled. The best tools for prototyping are a set of headset magnifiers, a good pair of fine-tipped tweezers, a fine-point temperature controlled soldering iron, and a roll of solderwick. When buying solderwick, DON'T get the type that says "no-clean". It doesn't wick work worth a @*!?. In fact, avoid 'no clean' solder. It doesn't flow as nicely as the regular type.

Whe soldering fine-pitch IC's, mass solder all the pins and then wick off the inevitable solder bridges. Works every time/

Gil,

If you re-read the ATS-3A instructions carefully again, you'll notice that Steve specifically recommends against the use of solder paste.

As to the "mass soldering" technique for fine-pitch parts, I'm not sure if you're telling me it worked for you, or if it didn't. I used to solder these things one pin at a time until I read about this technique. It worked the first time I tried it. Don't worry about wicking off too much solder - you can't do it.

As to cleaning, I like to use a toothbrush or a cut-down "acid brush" and a liberal amount of denatured alcohol (get it at your paint store or hardware store). I hold the board with one corner hanging down and start at the top, redipping my brush in clean alchohol as I go, and letting the alchohol on the board drip anywhere except into my clean diish of alchohol. As the alchohol washes down over the board, it will pick up more flux and it will get more concentrated with flux as it flows downward. You have to keep the brush saturated with clean alchohol as you work toward the bottom. If you have compressed air, you can blow the board dry, otherwise just wave it back and forth until the alchohol completely evaporates.

This technique hasn't failed me in hundreds of parts installed, it needs no special equipment or supplies, and doesn't suffer from too many steps that have to be followed carefully.

Your mileage might vary

Subject: Re: [AT_Sprint] soldering method for ATS-3a

I have built 3 ATS kits, a Micro908, and several smaller smt projects. I have soldered one component at a time using a doofus. Slow as you go is a virtue for me on these kits. I recently built a Digital Dial from KD1JV. I started with fine tweezers, my Hakko iron and fine solder. After 5 resistors, I was back to the doofus. I drink enough coffee in the morning to float a goose and that might have been the problem with just using tweezers. In using the doofus I do not pre-tin the pads. I set the piece, secure the piece with the doofus and careful tack one side, remove the doofus and solder the other side. Pre-tinning, in my experience, creates a convex pad and for me, and it is the dickens to keep the part straight on the pad. YMMV.
Joe, after trying the IC trick you mentioned on the Micro908, flooding with solder then wicking, I wanted to solder to my truck trailer the belt buckle of the fella who recommended the trick with the belt still around his waist. <g> Even after using "flux", I would not recommend that trick unless one observes it being done. Judging just how much

solder to use was my problem and I thought I'd never get it straight with wick. It is easier to describe than to do correctly, but it is a valuable technique for bench work once gets up to speed from what I hear. Unless one is a solder savant, I doubt if its gonna happen on one IC, however. Even with the finest pitched IC on the ATS kits, I can drop the narrow edge of my chisel point on one lead and drag solder from lead to pad neatly. With the occasional bridge, solder wick is helpful. It also pays to look at the schematic because some adjacent pins are connected by a trace so the bridge there is okay.
Joe, you burst my bubble with the caveat on the solder paste. I was ready to try that on my unassembled 3a and docking port. Is there a way to clean the board thoroughly to prevent the problem?

It will be simple but not easy to fix. Check the connections on all
the pins on the computer and DDS chips. If in doubt re-solder. If you
get a bridge between two or more pins use solder wick to suck away the
excess solder. It works easy and quick. Make sure the the 4 pins on the
crystal oscillator are soldered. You will get it going.

More to my previous 2 posts:

It escaped me until just now that some folks might be using PC boards that don't have a solder mask. My method assumes a professionally fabricated PCB with a properly designed mask that flows in between all the solder pads, otherwise all bets are off.

Subject: [AT_Sprint] ATS3a and T-1 tuner inside metal clipboard

I just posted a couple of photos of the sprint and T-1 tuner inside a
small metal clipboard. The idea being that while going about my job,
I can toss a wire anywhere and work stealth ops! The labels are kept
off intentionally. I don't want to stand out to much.

899. ATS-3a Build Post Mortem

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-06 17:40:31 UTC
From: duolian99
Topic: 899 Message: 899

I recently built an ATS-3a and ran into a number of challenges, as have others on the list. In general, though, things went reasonably well because the documentation was quite good. My main problem and frustration came from seeing my fading abilities (or disabilities, as the case may be). I used to do this for a living before I retired (about 7 years ago) and assumed I could build and test a board of this size in about 3 hours. Alas, that was not to be. I ended up taking over 7 hours to build, in several 1.5 hour sittings and another three hrs to debug - the main board only. Then another 1.5 hrs per module. Aaarrgh! My main obstacles were lack of patience, fading eyesight, and 'brain fade'. After building the board I checked it out carefully (I thought) with a 5x loupe. All seemed in order. Then upon applying power the '20m' message rallied forth and 'high hopes' ensued - prematurely , alas. My first discovery was that I couldn't get the right voltages to the switch Q4 - or out of the micro. hmmm. then pushing the MENU switch only got me two modes. hmm. after checking voltages around the micro I noticed that they would all drop to about 2v when I pushed any button or the paddle. Now what? the resistor pack was in right - I rechecked it. after much peering through the loupe at all angles of light I finally discovered that pin 2 of the micro - Vdd - showed light underneath - even thought it had been 'soldered'. After re-soldering it and reinspecting the whole board again the micro and TX section was working. Now on to the RX. My first test was to touch a test lead to U2 pin 1 expecting to hear some noise. Nothing. Twisting the board I heard crackling noises. Aha. another bad solder joint. Using a plastic tuning tool I pressed on various pins of U2 and U3. More crackling. Peering again with the loupe I found that pins 2 and 3 - which looked soldered - weren't. Damn. How many times I looked and didn't see. Re-soldering these now had the tail end of the receiver working. Now touching the test lead to pin 1 of U1 no noise. Or very little. couldn't find anything wrong. Later. Now on to the 20m module. Installed it and connected the output to a power meter. Test mode. key down. Nothing! what. Now I discovered there was no voltage to the finals. poking and wiggling I discovered it was C48. Apparently the volts were'nt getting from the bottom of the board to the top via the 'thru-hole' which apparenty wasn't plated thru. I applied heat to the pins - one by one - wiggled them until the cap lifted up a bit, then used wick to clean the pins and reflowed solder until I could see it well up a bit at the top of the board. (I ran into this problem with C54 too. At that point I decided to reposition all the electrolytic caps so that they were up a bit from the board so that I could see if the solder flowed through. I would recommend putting a toothpick under them when mounting - befor soldering - to ensure that they are up enough so

that you can see the solder flow through). Now the TX was working. Hooking up an antenna I tried peaking the RX input circuit. Could barely hear any difference. Tried tuning about. nothing . all of a sudden I came across W1AW code practice and it was blasting through. I peaked the cap on it. I then realized the reason for the lack of noise was the extremely narrow RX bandwidth. I then continued tuning around and found a few other signals. I then ran experiments to check out the tuning by key entry. Very slick. Nice selectivity. Low noise. Then I decided to sweep the band from 14060 down to 14000. Aiiieeee! It took over 732 minutes! I couldn't believe it was that slow. WHY? How could one possibly use this for general purpose? I ran some experiments with my MFJ Cub (one turn across band and 500 hz BW) and found that I could scan the same band in about 20 - 30 seconds and spot signals without passing them. And under current low activity band condx that's about how fast I'd want to do a 'look-see'. Perhaps someone holed up in a 'snow cave' - as somebody on one of these lists said (FYBO contest?) would be patient enough but not me... Anyway, since I was having an obvious 'bad hair day' I put the rig up for sale and sold it. Big mistake in hind sight. Oh well, I guess I'll have to build another - maybe using the paste and hotplate approach. I got to like it after playing with it the few extra days I had it because the buyer wasn't a kit builder and guilt drove me to build the other plug-ins - which I also didn't want to do. My left thumb still hurts and circulation is just coming back after squeezing down on those tiny coils. But I did manage to do the 80 m rx coil and link with no overlaps - every 3 or 4 turns I would stop and squeeze the turns together tight - it all just fits. and I particularly hated doing the 80m board - haven't been on 80m since 1954 with my HB 6AG7 rig and 3725 xtal and modified 'Midwest' receiver- but then discovered that I could work out of town, even out of state on 40m with an ARC-5 - man, did those things tune slow too, I think I wore out my fingerprints on the small knurled knob) and never looked back. Now that I did it once ... Hopefully the next version will have more and/or higher bands and faster tuning etc. My prefered bands would be 40, 20, and 15m. 10m would be nice but doesn't seem likely. 30 and 17 would be nice. 80 and 160m would be of no interest to me (antenna limitations). But it is a clever little rig. Great design job. Now the long wait... again..
73, Charlie ke2sp ps I was going to list the TX power measurements but lost them. From memory I recall over 3W on 20m and 30m, but only about 2.5W on 80 and 40 with about 8.5v key down.

900. Re: ATS-3a Build Post Mortem

From: Bruce Beford
Topic: 899 Message: 900

Well charlie. Quite a story.

Too bad you sold the rig. Most (all) of your troubles seemed to come down to soldering issues. This has been true with other reports of trouble. Good that you had the patience to work through the problems though. Shows tenacity. The built time you reported is about right. Something this small and delicate takes time and patience.

The tuning speed you reported- "over 732 minutes"- or over 12 HOURS to go 60 KHz. is NOT normal. When I power my '3a up, it starts at 7.030. If I hold the down button in, I am at the bottom of the band in exactly one minute. Thats 30 KHz/minute. This is a good tuning speed for a radio with the narrow filter this one has.

Sorry you had so much trouble. But your experience is not typical. Most of the several hundred sold have gone together fine. Some have had construction problems along the way, but I think all have worked well in the end. Hopefully, you will eventually get to try another, and have a better experience.
73,
Bruce N1RX

902. Hi all

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-07 06:02:26 UTC
From: Dominic Baines
Topic: 902 Message: 902

Hi all,

Just to introduce myself to the group.

Dominic Baines, M1KTA so from UK currently contracting for 6 months to a year as a DBA in Switzerland so will be operating as HB9/M1KTA shortly. Only managing maybe 10wpm at present but improving.

As I have time on my hands (XYL has stayed at home) in the evenings I am getting around to the kits I have collected over the years and wer unfinished.

My construction experience recently includes:

Whole suite of rockmites 10m - 80m
Couple of tenna dippers
N2PK VNA
IW3HEV analyser
SDR V4, v6 and v7 for 20m and 40m/80m
SW20+
OXO
Pixie
Tuna Tin II
Lots of VSWR, ATU, test kit etc...

So a 'splattering' of SMT experience amongst more convention construction.

I have an as yet unmade ATS-3 and was reading some of the group posts. Questions:

1. Should I modify it or build it vanilla?
2. Can the ATS-3 be made as an ATS-3a?
3. What are the differences?

Current operating rig history has been:

FT707 now sold
FT897 too big for portable
FT817 HAs everything but then I found these...
Rockmite 20m, 40m and SW20+

903. ATS3 and portable digital modes

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-07 07:52:32 UTC
From: Vojtěch Bubník
Topic: 903 Message: 903

Hi gang.

I am enjoying QRP digital communication and my goal is to build as small as possible portable setup. I wrote a multimode software for Pocket PC. Unfortunately this software needs an SSB transceiver to transmit digital modes. For those that did not hear about this software yet, it is freely downloadable from http://pocketdigi.sourceforge.net and there is a desktop windows version for playing with.

I contemplated about using DDS to modulate digital signals directly. It is possible to modulate RTTY, MFSK16 or olivia by DDS for sure. I am not able to design the whole TRX myself, but I am able to modify firmware of an existing device. The natural choice for my experiments is DSW by Smallwonderlabs, KX1 by Elecraft or ATS3 by Steve Weber. I decided to tinker with ATS3 because it's firmware is open.

The page of W1MT tells that I need either a TI MSP-FET430X110 board or Olimex MSP430-JTAG cable. I own a programmer Presto by www.asix.cz, which I bought for programming PICs. The manual says that it is able to program parts with JTAG interface, if the compiled program is provided in the CVF or XSVF format. Will that work?

It seems the current batch of kits sold out. Is there a plan to run another batch? Someone willing to sell his kit, built or unbuilt?

Hi Dom,

Let me answer between the lines....
Am Mittwoch, den 07.02.2007, 06:02 +0000 schrieb Dominic Baines:
>
> 1. Should I modify it or build it vanilla?
As you live in europe like me ,I'd say modify it to have full extent of fun. 40m evening on most and 30m on some days can be real hell with the original version.
Build up the mainboard and one Band vanilla first just to see it works. As you will use it in europe I 'd recommend you to build in a Mosfet-T/R switch and use (e.g.) my narrow 2 section rx_filters. If you chose to do so you have to build up all bandmodules modified as the former BK_diodes_pin gets now the input of the rx filter coming from the T/R switch.
> 2. Can the ATS-3 be made as an ATS-3a?
Yes, you can give it all properties of the ATS-3a without loosing the wideband reception. It is not too difficult. You 'd have to do the following mods:
> 3. What are the differences?
>
1. The major one. Build in a T/R switch from 2 2N7002 ugly style. see photo and schematic in my gallery here in this group (DL2HRP) NO more BC distortion...

2. Improve the match and termination of the IF crystal filter. Two ways to do it. See Michaels W1MT homepage for the narrow band variant (L section) built as "Teepee"
Harry OE6GC did it with small transformers. However the result is a flatter response with less insertion loss that sounds simply great.

3. Incorporate one of the spare BAV90 diodes across U3a 's feedback to have a limiting and avoiding audio distortion in situations with real strong signals around.

4.Rather small corrections to audio response to further improve it. Either you take values from ATS3a schem or look at W1MTs homepage again. OE6GC has an interestig variant of that mod too.

I did them all except Point 4. (planned soon) and will never sell that rig. I am afraid , it already became some kind of obsession to me :-). What do you want more - a great receiver -even here in europe, smooth full BK , RIT, XIT, builtin Keyer, vy low power consumtion at a size of a credit card....

Vojtech,

While it is possible to use the DDS to directly generate phase modulated signals, it isn't practical because the DDS has no way to limit the rise and fall times of the phase transitions - it can only make instantaneous changes. This would cause the bandwidth of the modulated RF signal to be excessively wide, otherwise known as 'splatter'. There is a method to make a nice clean spectrum with a phase-modulated on-off keyed transmitter, but it involves turning the transmitter off at the end of a bit, making the phase transition, and then turning the transmitter back on for the next bit. The transmitter on and off rise and fall times have to be carefully controlled. They have to be large enough to prevent spectrum spreading but small compared to a bit time. This technique has been written up on the web. search for "Medfer Beacon" for more details.

Hi Joe.

Thanks for the info, I am aware that the envelope of PSK31 signal has to be shaped by raised cosine. I even did some simulations to measure IMD if I key a CW transmitter with a simple exp envelope. The IMD was very high.

I did study this article. He actually modulates the envelope by PWM, which is more complex then simply key on the signal a bit later after the phase change and switch off a bit sooner before the other phase change.

But anyway, the MFSK16 or RTTY signal has a constant envelope and I am sure that Olivia would work with constant phase envelope too.

OOOoopps so that's where the "73" went! No it wasn't 732
minutes but 2 minutes to tune from 14060 down to 14000 (like
yours. but seems long to me)(I get 'bored' waiting thru a 3 minute
beacon cycle too - especially since I'm not hearing any lately!?)
the "73" was the missing part of my ending byline (ie "73, charlie
ke2sp etc") I started typing and it didn't show up so I just
repositioned the cursor and didn't think to look for where it had
been. Anyway, yes you are right - patience and tenacity .
hopefully I will get to build another. Neat little gadget. however,
I did run into another 'challenge' that still outwits me - how do
you get the drill drawing to print out at correct size? everytime I
tried it came out 8" x 10" . Another problem was the drilling of
the altoids box. Since I'm in a 'portable' situation I only have
limited tools and my moto-tool max drill size is 1/8" but my rat-
tail file is bigger so I'm forced to enlarge the hole by pushing
the drill sideways until the rat-tail file will fit in. so the hole
moves from where marked/started. not good. Does anybody know where
one can buy a 1/4" drill bit with a 1/8" shaft. that would work
nicely.
thanks. charlie ke2sp

Hi Charlie, KE2SP

Perhaps a trip to Harbor Freight for one of their punch sets is possible, if there's a store near you. Otherwise most hardware stores have small round files for re-sizing those 1/8" holes. It may also have a tapered reamer that will fit. I use one often for enlarging holes in Altoids or Whitmans. I dont try to power it, just twist it by hand. Another option is to buy a tapered grinding stone if your moto tool is a Dremel type with a collet.

Here's my ATS3 page. http://www.wa0dx.org/wa0itp/ats3.html It has some hints, hope you find them helpful. If you'd label, pse let me know.

Good luck.

Gill,

my concept is very different. N4QA drives the DDS by a parallel port of a desktop PC directly and lets a RTTY software toggle the FSK pin of the DDS. That means lot of ugly hardware changes and I am not sure whether the TRX will be usable standalone after the changes are done.

I want to extend ATS3 firmware and use the keyer socket as a serial line for programming DDS and keying. The software that will control ATS3 will be PocketDigi on a Pocket PC device.

Vojtech,

I think you're going to have a very wide spectrum unless you find a way to limit the slew-rate of the frequency transitions. Has N4QA published a spectrum plot of the output?

Gil,

If that plot was taken through a PC sound card software, then it's misleading. In order for the signal to get into the sound card, it has to go through the receiver's IF filter. Therefore the IF bandwidth of the receiver will determine what the wide-band spectrum of the transmitter looks like. The bandwidth could have been (and probably was) much wider than what is displayed.

I think you're going to have a very wide spectrum unless you find a way to limit the slew-rate of the frequency transitions. Has N4QA published a spectrum plot of the output?

Joe,
There's a plot in the second link I posted this a.m. Scroll down the page.

You have to open and print the file with MS Paint. Paint will print to
scale. Most graphic viewers scale to fit page. There maybe other graphic
programs which will print to scale, like photo editing programs, but nearly
everyone has Paint as part of the windows operating system.

While the DDS will change its output frequency nearly instantaneously, it does it in a phase contiunous mannor. Because of this and the relatively small frequency shift for TTY, I don't think there is much of a problem.

As for PSK, instead of doing abrupt 180 degree phase changes, I would think you could do it in smaller steps and simulate the cosine phase change rate. A simple look up table could do this.

Really, the main problem with using the ATS rigs with digital modes is that the PA isn't meant to be used in continues duty output. One possible way around that is to run the rig with reduced supply voltage/ power output and drive a little outboard linear, maybe something as simple as a single IRF510 or 511.

Charlie hopefully I can be of some help. I cannot help with the drill bit. Take the altoid tin and mark up where you want the holes first. Then take a small nail and a piece of wood and hold the tin in a vice or similar and make a mark for the drill bit. You do not have to put the nail right through justenough for the drill bit to stay put. If you have a punch or similar even better. If you need a larger hole then mark the edges and file a larger hole using the two holes as the outer edges.

I do this and every time I get perfectly placed holes for my altoid projects using a set of needle files and a 3mm drill bit. To fit a BNC I make 4 evenly spaced hole and file between them. Patience is important if you want an acurate hole.

Another option I have used is to fill the tin with water (yes water!) and freeze it. The tin when frozen it is easy to drill the sides.

I mark the hole locations on the tin using a CD writing pen.

I have probably 15 or more altoids tin projects.

MFSK16 modulator does exactly this and I did not hear any complaints about excessive bandwidth.

> A simple look up table could do this.

PSK31 decoders use the amplitude envelope to sync. I am affraid that most of PSK31 decoders will not be able to sync to a PSK signal with constant envelope. I simulated a BPSK31 signal with a simple RC shaped CW envelope and the decoder was able to sync and decode successfully.

Steve, do You plan to run another batch of ATS's? How about to learn them to talk digitaly? I am desperately looking for someone to do the hardware job. While I am a good programer, the hardware that I create ends up in the flames quite often.

Hi Gill.

You will find spectrograms of MFSK16 signals here.
http://www.qsl.net/zl1bpu/MFSK/Index.htm

The frequency is switched instaneously without a phase change. This is what the DDS may do itself very precisely. I do not think that the signal is too wide, espetially at QRP levels.

Topic: 922 Message: 922

Hi I'm new to the grp and have had a ats-3 for quite a while and just love the rig, but one thing thats hard for me to get use to is the cut numbers for the frequency readout. My brain has to do a double take every time I use this feature. I was just wondering if this was done for programing reasons or just Steve's personal choice. It's something I can live with, but would of prefered a normal readout of the numbers.

Thanks

Vojtech,

If you have an idea for how to implement the digital mode modulations directly at the RF frequency without need for a linear SSB exciter, then I would be willing to develop the hardware and PCB. I already have a couple of add-on ATS enhancement projects underway in my CAD system, but it might be better to start from scratch and make an "ATS-like" rig that was intended for digital from the outset. If we can agree on a design, I'll develop PCBs and share with you. Feel free to contact me off-line if you want to discuss further, as I've also given a lot of thought to what I want and how I'd implement it.

Hi Joe.

I will discuss it on the list until we get into much details. I hope others will be interested too.

The DDS itself allows direct FSK or PSK modulations, only one tone may be sent at an instant.

The digital modes may be roughly split into three groups:

1) Constant envelope single carrier - CW, CCW, RTTY, AMTOR, MFSK16, FELD HELL, PACTOR1, DOMINO, HF Packet
2) Single amplitude modulated carrier - PSK31, Olivia(*), PSKHELL,
3) Multitone - MT HELL, THROB, MT63, PACTOR2/3, fancy mode IDs

(*) The Olivia tones are ovelapping slightly in time, but with a slight loss of S/N at the receiver it is possible to use other shaping to produce only one tone at a time.

Let's forget the multitone modes that would really need a SSB modulator. The other modes may be realizable with the hardware of ATS3, if the RX/TX switch is modulated by a PWM. I am not sure whether the MCU of ATS3 will be powerfull enough. Even if PWM is not used, it shall be possible to modulate 1) perfectly and 2) with some compromises on signal quality.

If you want to design a transcever for single carrier modes - 1) and 2), a good choice may be to generate the envelope by the PC or PDA sound card at say 3kHz, to rectify it at the TRX and use the voltage to modulate the PA. This would give the PSK31 signal a perfect envelope.

Look at the MedFer modulator. http://www.ka7oei.com/am_tx1.gif
The PA in E class is modulated by a PWM generated by the PIC.

I don't speak for Steve, but I kept his cut numbers in
my version of the software mainly because the less
time the rig is using to annuciate the frequency the
more I can listen to the airwaves. At one time I was
announcing the full freq (MHz down to the 10's of
Hz)---just too much time spent in annunciate mode!

There is no cost difference (for programming) between
a "t" and a "0".

Vojtech,

One of the big challenges I see in trying to make a 'pure digital' implementation is that ehe available software products only provide an audio output, whereas the digital modulator requires a digital input. To make things more difficult, modes that use multi-bit symbols (eg, MFSK) require that the user bit-stream be reassembled into n-bit symbols. This isn't difficult if you have access to the baseband bit stream, but it is challenging if all you have to work with is the audio output of a sound card and a low-end microcontroller.

Ideas??

I am using Cash Olsen's method for mounting the SMD parts on the 3-a board and have most of the parts in place on the top of the board.

I am missing parts that were not included in the kit specifically they are as follows:

the package marked Yellow/red stripe 470pf cap which goes to C 17

the package with markings LIGHT Blue/red Stripe 220p which goes to C 36

Anyone know where I can source these parts and if so what are the stock numbers?

Steve says he does not have any of these..
Time is an issue as the parts need to be soldered in palce shortly

Thanks in Advance
John

For PSK-31 envelope shaping, it should be possible to feed a raised-cosine curve into the PNP transistor (or is it a P-channel MOSFET?) that supplies power to the ATS-3's power amplifier. It would go in place of the CW envelope shaping that's there now. Or perhaps some analog circuitry could create the desired raised-cosine curve when prompted by the microprocessor, whenever a phase shift was about to take place.

> This isn't difficult if you have access to the baseband bit stream, but it is challenging if all you have to work with is the audio output of a sound card and a low-end microcontroller.

Define "low-end"? I'm not familiar with the uP family Steve's using, but the dsPIC has 200 KHz multiplexed A/D inputs and can do a 16x16+32 mul-add every cycle at a reasonable clock rate, and Microchip has example software for filters, FFT's, and modems. The cheapest parts are about $5 from Mouser. I'd love to see some of the HF digital modes implemented on one of those.

Bill,

I'd love it too, but it's way beyond the scope of what I'm willing to sign up for.

When I said 'low end", I was referring to the MSP430, but if I were starting from scratch I'd probably use something like the PIC18F2620, only because it has lots of memory, I/O, and internal peripherals and because I already have experience and the tools to develop for it.

Joe

John,
Sorry but I don't have the caps, but were you able to find
the beverage warmer at Wallyworld?
None at my store; the candle electric warming plates for
scented candle oil are similar, but only heat up to 76 C.
There is a question about the plastic's ability to withstand
the hot air gun as well. If I can't find a beter option,
I'll try wrapping the plastic in alumimum foil. I also
"stepped" up the diameter of the heating surface by stacking
thin slate disks of increasing diameter to transfer the heat
upwards to give the board full contact with a heated
surface. The hotplate's surface is smaller than the board.

Well, the idea is to extend the terminal software. Look at PocketDigi
http://pocketdigi.sourceforge.net

You could download the desktop binary and play with it. The binary is about 200k big and it implements most of the nowadays used modes already. The program was derived from gMFSK, which is a Linux multimode terminal. The sources GPLed. The software runs on any 200MHz pentium and any 200MHz Pocket PC device.

I thought about this one year already. My intention is to extend the software to generate a slow async serial stream over one soundcard channel and it would be possible to generate the amplitude envelope by the other sound channel. The digital signal may be generated at 44kHz, every sample has to be 2x duplicated to go through the antialias filter. After the sound signal is amplified and limited, it will generate a nice digital serial stream at 22kBd synchronized with the amplitude envelope. You don't need more informatin to describe most of the digital signals used by HAMs nowadays.

There will be minimal requirements on the TRX's processor and firmware. The firmware would get the mode command, main tuning word and during the modulation it would only get increments of the tuning word or a phase (0,90, 180,270). Just after it receives the modulation word, it adds it to the main word and sends it to the DDS. So the modulation will be clocked by the rate by which the sound card generates tuning words.

It woud be nice if the new ATS would contain the PA AM modulator circuit and sound to serial amplifier/limiter. If the ATS has to be kept small and lightweight, there may be possible to add an additional board holding just the AM modulator and serial stream shaping circuit.

>>After the sound signal is amplified and limited, it will generate a nice digital serial stream at 22kBd synchronized with the amplitude envelope.

I'm a little fuzzy about how you'd send baseband data through the soundcard, as the output is probably AC coupled.
What would be the format of this serial stream? Does it stay in one state when no characters are being transmitted? Does it have a DC component? (if so, there will be a problem with baseline shift as it passes through the coupling cap in the sounscard).

Also, if the mode is expressed in the transmitted data, then why the need for a seperate channel to tell the transmitter when to switch the envelope? Can't the transmitter figure it out from the contents of the data stream? And why such a high rate (22kb)? Can it be slowed down to give the micro in the TX more time to do the things it has to do?

Well, the idea is to extend the terminal software. Look at PocketDigi
http://pocketdigi.sourceforge.net

You could download the desktop binary and play with it. The binary is about 200k big and it implements most of the nowadays used modes already. The program was derived from gMFSK, which is a Linux multimode terminal. The sources GPLed. The software runs on any 200MHz pentium and any 200MHz Pocket PC device.

I thought about this one year already. My intention is to extend the software to generate a slow async serial stream over one soundcard channel and it would be possible to generate the amplitude envelope by the other sound channel. The digital signal may be generated at 44kHz, every sample has to be 2x duplicated to go through the antialias filter. After the sound signal is amplified and limited, it will generate a nice digital serial stream at 22kBd synchronized with the amplitude envelope. You don't need more informatin to describe

most of the digital signals used by HAMs nowadays.

There will be minimal requirements on the TRX's processor and firmware. The firmware would get the mode command, main tuning word and during the modulation it would only get increments of the tuning word or a phase (0,90, 180,270). Just after it receives the modulation word, it adds it to the main word and sends it to the DDS. So the modulation will be clocked by the rate by which the sound card generates tuning words.

It woud be nice if the new ATS would contain the PA AM modulator circuit and sound to serial amplifier/limiter. If the ATS has to be kept small and lightweight, there may be possible to add an additional board holding just the AM modulator and serial stream shaping circuit.

BTW Vojtech,

In my preferred embodiment, I was going to use a USB-serial chip (www.ftdichip.com) to connect the rig and the computer. This would make the interface clean and it would allow the computer to power the rig (at least for Rx and low power Tx). If you're going to modify the computer program, could you just use a USB virtual COM port to send serial data to the rig? Since it's going to be there anyway, why not use it and eliminate the complexity of more cables and more more interface circuits?

The format may be an 8 bit serial stream. There will be -255, -255 for serial 1 and 255,255 for serial 0 put into the stream.
I am affaid about the AC coupling slightly, but the stream may always be scrambled to make it more random to get rid of the DC. I once planned to do some tests, but I was too busy by developing PocketDigi.

> What would be the format of this serial stream? Does it stay in one state when
> no characters are being transmitted? Does it have a DC component? (if so, there
> will be a problem with baseline shift as it passes through the coupling cap in
> the sounscard).

I propose to let the signal drop to 0 between packets. Positive voltages will be detected as logical 0, voltages around 0 and negative will be detected as logical 1. It shall work with short cables in my opinion. I think that with the PC cards it may be sufficient to clamp the signal by one zener diode to get a digital signal. It will not work with Pocket PCs, which sound cards generate much lower amplitudes.

The digital modes in use usually have a constrained number of states. MFSK16 uses 16 tones, Olivia 32/xx uses 32 tones. BPSK31 uses two phases, QPSK31 4 phases. I propose to load the DDS words into the internal memory of the firmware on the start of the transmition and to send just the address of the tuning word on each transmitted symbol.

The 22kbit speed will allow you to send about 2000 bytes per second. That's not much. If the controller in the transceiver does not have a hardware UART and the stream would have to be received in a loop, the data need to be send fast enough to let the controller do something else in the gaps between the transmitions. 22kBit is maximum realisable with a common sound card.

The controller may generate the envelope itself. You would have to program the envelopes into the controller. If another mode will be added, the envelope would have either be uploaded to the controller, or an updated firmware would have to be flashed. Additionally it would mean a more complex firmware. But if you modulate the PA by a rectified signal from the second channel, there will be no support needed in the firmware and the control computer would have full freedom to change the envelope.

I am not saying that the solution with the envelope generated by the second sound channel is the best one, but is certainly feasible and in my opinion the easiest one to implement both in HW/SW. The firmware solution is nicer from the engineering point of view, but my

resources are too constrained to implement a fancy firmware.

I'm very concerned about the DC component of the data. As you suggested, you could scramble it with a pseudo-random key but then the micro in the rig would have to descramble it again - no time for it to 'take a breath' and do something else. The more real-time burden that's placed on the micro in the rig, the less time it will have for some other real-time features I had planned. I guess we could put in a small dedicated micro just to handle this, but I was hoping to keep it simple.

Do you see a difficulty in just sending the Tx data over the USB serial? In my present embodiment the USB connection will be there anyway for rig control (frequency, volume, etc). With an extension to the serial protocol, you could send mode information that would let the micro in the rig know whether to perform envelope gating between symbols, what to use for the slew waveform and rate, etc.

Is this beyond the scope of the mods you intended to make to the PC/Handheld program? If this is to be a cooperative effort, then somewhere someone will have to step up to some changes to their approach.

Joe

Hi Joe.

The reason not to use USB is that only a fraction of Pocket PC devices support USB host. Even if the Pocket PC device supports serial over USB Host, the cables are clumsy and expensive. And the speed is really not nescessary IMHO.

Vojtech,

If we limit this to Pocket PC , we'll severely limit the applicability for most of this group.

How about some other form of serial data interface, such as RS-232? I could make provision in the interface for both standards.

Joe

944. Soldering SMD parts WOW!!

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-08 16:04:55 UTC
From: pipesanddrums17
Topic: 944 Message: 944

First off I had decided to use Cash Olsen's method for SMD soldering
http://www.zianet.com/erg/SMT_Soldering.html
and had most of the parts in place on top of the 3-A board when I
discovered a couple were missing. There is a time element involved
with this process so waiting a week for the parts was out of the
question.
I decided it best to go ahead and get everything soldered in and do
the remaining couple parts when they are delivered.
At first I was a bit skeptical about trying this method but let me
tell you it was a pleasure to see the parts all fall into perfect
alignment as the heat was applied. Within 1 minnute after heat from the
embossing gun was applied all the parts were soldered in place with no
solder bridging between the legs of the IC's.
It has been awhile since I have worked with SMD and my eyes aren't what
they used to be however, I think that attempting this job without
Cash's method would have been a big mistake this made things much
easier and the results are amazing.
Only problem was that the board is a bit too big to fit on a
beverage warmer so I just used the hot plate that's on the coffee maker
which was perfect.

Its irronic that digital modes are most easily implemented with an analog rig<G>

Keep in mind I do plan on doing a SMT SSB rig at some point. It won't be as small as the ATS rigs, to a large extent due to the space requirements of the linear amplifier.

Making it mulit band is something of a challenge, due to the Tx mixer band pass filter requirements. My thought has been to make this a 17 to 10M rig, as I can use a single Tx LPF and a wide band pass filter for the Tx mixer and a similer one for the Rx input. The main thing is to keep the IF (8 MHz) and VCO (26-36 MHz) out of the PA.

I've built one of these and it basically works, but there's a little too much VCO in the Tx output and the VCO doesn't have quite enough span to get all the way into the 10M band. (PLL VFO)

The project is currently on the back burner, as it will still be awhile before the high bands start to show life. Maybe a better choice of bands would be 20/17/15 for the near term. Hopefully, I'll have time to work some more on this proect in the near future.

Steve,

Have you considered making a phasing exciter using something like a Tayloe mixer in reverse? You'd have to run the DDS at the output frequency and put individual RF phase-shift networks on the band modules, or alternatively run a DDS at 4x the operating frequency and use a digital multi-phase generator. The former could possibly be accomplished with the 9834 DDS and would be fairly power efficient. The latter would be less complex from a circuit standpoint, but would probably be a power hog. Either way though, you'd eliminate the mixer-filtering-spurious problems.

I've considered it, but not too seriously. IMOHO, your trading one can of worms for a bigger one. The mixer is simple, but what you have to connect up to it to make it work isn't, no matter what approch you take.

You're referring to the phasing networks I presume?

I think the audio network is pretty straightforward these days, but the RF phasing network can be a challenge in a multi-band radio. I was considering individual LC networks with varactor fine-tuning from a PWM output on the micro driven by a lookup table. This way the RF phase shift variation could be compensated in firmware.

mixer in reverse?

I've considered it, but not too seriously. IMOHO, your trading one can of
worms for a bigger one. The mixer is simple, but what you have to connect
up to it to make it work isn't, no matter what approch you take.

If the transceiver is used just as a modem for digital modes, phasing exciter seems to be attractive, because the master computer may provide the 90 grades phase shifted baseband signal already. But the AF phase shifter will be needed for standalone SSB anyway.

The phasing exciter needs a quadrature local oscillator. If the transceiver is multiband and is not constrained to a narrow subbands, the RC phasing is too narrow band. My friend Peter OK1XGL actually did some tests and one RC phasing was not exact enough for the whole 80M SSB subband. The option is to run the oscillator 4x faster and divide it, for 10M band you will end up running the oscillator at 112MHz. If you use a DDS, you would either have to use two of them, or use a DDS with a quadrature output, or you will need something clocked at 300MHz, which will not be power efficient anymore.

I built an 80m phasing receiver with two NE612 mixers, RC LO phasing and an AF CW filter. It works well, but was quite difficult to debug. The main problem is huge AF amplification and resulting AF loopbacks, and leakage of the LO outside the TRX , modulating of the LO on the power supply rectifier diodes and receiving back the 50Hz AM modulated signal.

If the first mixer gets overloaded as it is usuall at 40M in Europe, it will AM demodulate the strongest signals. In case of superhet the AF products will be clipped by the IF filter. This is a great advantage if active mixers are used. On the contrary, the AM demodulated signals will be heard in the phasing receiver.

So generally it is easier and more straightforward to build a superhet than a phasing TRX. But anyway, IMHO for portable digital QRP operation the direct modulating of the DDS ist the way and only slight circuit modifications will be needed for ATS3 - bigger AM modulated PA, serial interface to a master computer.

Vojtech,

My comments about implementing a phasing exciter were somewhat accademic, as I'd prefer to implement digital-mode modulation right at the DDS and the final amp if possible. However, I do want to re-emphasize my point that implementing a good phasing exciter is somewhat easier than implementing a good phasing receiver. To your point about RC phasing networks, they can actually be a good choice under some circumstances. This is because a pair of RC "L" networks, one the inverse form of the other, will develop a 90 deg output-voltage phase relationship at all frequencies - only the amplitude relationship changes. In theory, this can be remedied with a pair of ideal zero-axis limiters (assuming sine wave), but the limiter design imposes other broadband challenges. A simpler approach would be to do something with a lookup table in the micro and a digipot to fix the amplitude variations. But enough of this - back to the discussion we were having.

Can you describe in further detail how you'd propose to send the digital data stream over, say, an asynchronous connection such as RS-232? How would you multiplex the phase information with the envelolope information and how would you seperate them at the Tx end of the link? Can you propose a protocol to also multiplex rig control information on the same serial link? If we can agree on a method, we can begin to exchange some hardware block diagrams, which will lead to schematics and a PCB.

As I said in a previous email, I was already working on an "enhancement" daughter board that would plug into the ATS programming header in order to implement remote computer-based rig control. That design also implemented remote volume control and provision for firmware-driven RF AGC of the receiver (there's a dedicated PIC18F2620 on the daughter board). If we can develop a very simple interface circuit and firmware to implement the digital mode modulations as discussed, then I'd extend that daughter board to also plug into the ATS band module socket so that the new exciter could be on the same interface board.

More on this...

It seems to me that any amplitude envelope that the common digital modes exhibit (eg, PSK31) is a by-product of the slew-rate-limited phase transition which is a necessity in order to contain the spectral sideband energy. Therefore, I don't think you have to intentionally modulate the envelope to develop these spectrally-contained phase modulations, you just have to make the 180 deg phase transition (PSK31 case) in a smooth, continuous, time-limited manner. This could be accomplished entirely in the DDS by 'ramping' the phase offset register in as many fine steps as are available over the prescribed time interval and according to a prescribed curve. This isn't a perfect solution, as the number of steps in the phase register is finite, but it would probably be sufficient for QRP work. One of our mathematically inclined colleagues needs to comment on this.

It is not. The signal is artificially AM modulated. Look into any source code of a PSK31 modulator. And the AM envelope is really needed by an usual PSK31 decoder to extract sync.

Slowly changing phase from 0 to 180 grades does not modify the amplitude. Phase and FM modulations are very similar, there is a transformation of the baseband signal to convert phase modulation to FM and vice versa. And I think we agree that FM is a constant envelope modulation.

You're right!

I guess my reasoning was corrupted by thinkinkg about how you'd implement it with a linear hardware modulator (eg, a double balanced mixer). As the modulating voltage is varied through the point where the 180 degree phase transition occurs, the envelope also decreases to zero and then back up to full amplitude. Obviously a purely digital phase modulator doesn't do this (unless it is followed by a narrow bandpass filter)....stupid me!

However, the complex modulation could still be accomplished entirely in the DDS by putting a digipot in the DDS's DAC current control and using it to adjust the DDS output level during the phase transition. Of course then you'd have to deal with inefficient linear post-amplifiers after the DDS, but I'm not sure you'd be a whole lot worse off than if you tried to implement envelope control at the final amplifier. To preserve the amplitude modulation component in the latter case, you'd need to modulate the supply voltage to the final with a linearly variable switch, and a lot of DC power will be burned up during the slow switch transitions where the switch is neither off nor on. If linear amplifiers are used, one might improve efficiency somewhat by developing a post-amplifier that's only linear during the amplitude transitions, and is rebiased to a more efficient mode during the high or low state of a symbol.

After thinking about this, I'm not convinced it's an issue. Even if the 180 deg phase shift is done purely digitally and without an apparent envelope, an amplitude varying envelope will develop after the signal is bandlimited by the receiver's IF filters and by any pre-detection DSP bandpass filtering done in the software system.

Thank you for the discussion and suggestions. I have decided to take Rick Bennett's advice and not use the skillet/oven technique on my ATS3a kit. However, the technique is interesting and I plan to try it out with, for example, the Norcal SMT dummy load kit. When I know exactly how to do it, I may then tackle a larger pc board.

The doofus looks good. Terry, is that a wooden tooth pick on the end? How did you secure it?

I intend to use the solder supplied by Steve for the ATS3a, but I have a roll of Kester Sn63/Pb37, .015 dia., solder without flux. Would it be advisable to use this solder with SMDs with a small amount of paste flux on the pads?

> you seperate them at the Tx end of the link? Can you propose a protocol to also
> multiplex rig control information on the same serial link?

I do not have a protocol design on paper or electrons yet.

The first solution - only receiving a sound card generated serial stream - is much easier. The amplitude is generated by one channel, the phase or frequency modulation commands by the other channel. The sound serial data would be synchronized exacty and no additional work would be needed at the side of the TRX. The TRX would only need to receive the modulation command, translate it to a DDS word and feed it to the DDS instantly. There will be additional commands to set the main tuning word and key the transceiver. The firmware would not need to know and maintain modulation clock.

If the transceiver is driven by an asynchronous serial port (RS232 or USB), it would not be possible to derive modulation speed from the serial stream anymore and the firmware would need to maintain its modulation clock. The symbol speed would have to be sent to the transceiver at the start of the transmition. The transceiver would have to keep buffer of comands to accomodate to the jitter caused by the higher level OS (Windows, Linux). Additionaly, the transciever would either have to keep amplitude envelopes flashed in the firmware, or it would have to receive them from the master computer and store them in RAM/Flash.

If I have to propose a protocol, I would probably design a simple framing 8bit protocol with FE as a frame start, FF as a frame end, first byte after FE would be a command, the other bytes in the frame would be optional. An escape character FD will be used to translate FE and FF into FD00 and FD01 inside the frame.

Commands
00 - key off
01 - key on
02 followed by the 8 DDS bytes to program main DDS frequency.
03-66 would be reserved for modulating maximum 64 mfsk tones
67-70 for modulating phase changes 0, 90, 180, 270
71 followed by a phase increment to program frequency shift for mfsk modes
72 followed by a modulation time increment, in clock cycles of the TRX firmware
73 followed by an envelope shape to store the envelope somewhere on the TRX CPU
74 to to select one of the flashed envelopes
etc.

The simple commands like keying and modulation would be 3 bytes long. For the sound card clocked modulation the commands 72 - 74 will not be needed.

My friend Peter OK1XGL proposed something similar. The DDS's DAC current control may be driven by the firmware PWM or D/A.

I am not that good at circuits to judge that. There were proposals to AM modulate an E-class PA. That will probably be more power efficient than modulating the DDS's DAC current control and using linear PA, but the second solution will be simpler, lot easier to set up and wideband. If a new transceiver have to be designed, I would prefer the second solution.

If the phase is shifted abruptly without AM modulating its evelope, the transceiver would generate a signal tens of kHz wide. It seems to me correct, that after the signal is filtered by the receiver and by the narrow digital filters in the software, the amplitude envelope will be recovered. But you do not need to be that rough to the other hams sharing the band with you. If you key the transmitter off before the phase reversal and key on just after the phase reversal, the effect will be the same and you will not waste that much bandwidth.

If you vary the phase slowly, it will be kind of a gmsk modulation, see
http://en.wikipedia.org/wiki/Gaussian_minimum_shift_keying
MMVARI supports that mode. An usual BPSK31 decoder will not be able to sync to this signal.

The first solution - only receiving a sound card generated serial stream - is much easier. The amplitude is generated by one channel, the phase or frequency modulation commands by the other channel. The sound serial data would be synchronized exacty and no additional work would be needed at the side of the TRX. The TRX would only need to receive the modulation command, translate it to a DDS word and feed it to the DDS instantly. There will be additional commands to set the main tuning word and key the transceiver. The firmware would not need to know and maintain modulation clock.

Vojtech,

Let's go with this idea for a while....
In the audio channel that contains the data.....how do you intend to encode the transmitted data in the sound card audio output? Will it be an /off keying of the 22KHz (or 44 KHz) clock, or will it be actual baseband data? Assuming low symbol-rate data, the former would be easier to handle as all that would be necessary in the hardware is an audio envelope detector and a slicer. If the latter is employed (baseband data), then we get back to possible problems with baseline shift (especially considering output volume control settings), unless you scramble the data or use an encoding method that has no DC component (eg, Manchester). More work for the local processor to do too. Same question goes for the envelope control channel - is the envelope switching information conveyed by presence/absence of an audio tone, or is it encoded in some data format?

The idea of a separate audio channel to control envelope switching puzzles me. Why doesn't the local processor, knowing which mode it's in, just set the carrier phase/frequency, ramp the carrier on according to the prescribed turn-on function, turn the carrier off according the same function, set the phase/frequency for the next symbol, etc? The sequence of commands from the host is:

1) Send desired RF transmitting frequency
2) Send desired mode (BPSK, MFSK, etc)
3) Send start-of-transmission command (enter Tx mode)
4) Send all the symbols in the message stream as described above
5) Send end-of transmission command (return to Rx mode)

The lookup tables for the the mode settings and the carrier turn-on/turn-off function could be hard coded in firmware or they could be downloadable.

Also, the above sequence could just as well be sent over an async serial channel such as a COM port.

The transceiver would have to keep buffer of comands to accomodate to the jitter caused by the higher level OS (Windows, Linux). Additionaly, the transciever would either have to keep amplitude envelopes flashed in the firmware, or it would have to receive them from the master computer and store them in RAM/Flash.

If I have to propose a protocol, I would probably design a simple framing 8bit protocol with FE as a frame start, FF as a frame end, first byte after FE would be a command, the other bytes in the frame would be optional. An escape character FD will be used to translate FE and FF into FD00 and FD01 inside the frame.

Commands
00 - key off
01 - key on
02 followed by the 8 DDS bytes to program main DDS frequency.
03-66 would be reserved for modulating maximum 64 mfsk tones
67-70 for modulating phase changes 0, 90, 180, 270
71 followed by a phase increment to program frequency shift for mfsk modes
72 followed by a modulation time increment, in clock cycles of the TRX firmware
73 followed by an envelope shape to store the envelope somewhere on the TRX CPU
74 to to select one of the flashed envelopes
etc.

The simple commands like keying and modulation would be 3 bytes long. For the sound card clocked modulation the commands 72 - 74 will not be needed.

> multiplex the phase information with the envelolope information and how would
> you seperate them at the Tx end of the link? Can you propose a protocol to also
> multiplex rig control information on the same serial link?

I do not have a protocol design on paper or electrons yet.

The first solution - only receiving a sound card generated serial stream - is much easier. The amplitude is generated by one channel, the phase or frequency modulation commands by the other channel. The sound serial data would be synchronized exacty and no additional work would be needed at the side of the TRX. The TRX would only need to receive the modulation command, translate it to a DDS word and feed it to the DDS instantly. There will be additional commands to set the main tuning word and key the transceiver. The firmware would not need to know and maintain modulation clock.

If the transceiver is driven by an asynchronous serial port (RS232 or USB), it would not be possible to derive modulation speed from the serial stream anymore and the firmware would need to maintain its modulation clock. The symbol speed would have to be sent to the transceiver at the start of the transmition. The transceiver would have to keep buffer of comands to accomodate to the jitter caused by the higher level OS (Windows, Linux). Additionaly, the transciever would either have to keep amplitude envelopes flashed in the firmware, or it would have to receive them from the master computer and store them in RAM/Flash.

If I have to propose a protocol, I would probably design a simple framing 8bit protocol with FE as a frame start, FF as a frame end, first byte after FE would be a command, the other bytes in the frame would be optional. An escape character FD will be used to translate FE and FF into FD00 and FD01 inside the frame.

Hi Joe.

Good news first. Ron Pfeiffer N1ZSW donated his ATS-3A for my Pocket PC / DDS experiments! Thanks a lot, Ron!

> In the audio channel that contains the data.....how do you intend to encode the transmitted data in the sound card audio output? Will it be an /off keying of the 22KHz (or 44 KHz) clock, or will it be actual baseband data?

Baseband data. I once tried to generate random digital data and feed them back to microphone input. I sent every value twice. The data looked digital enough. But anyway, our discussion is meaningless until it is actually tried. I hope to experiment with it the second next weekend.

> If the latter is employed (baseband data), then we get back to possible problems with baseline shift (especially considering output volume control settings), unless you scramble the data or use an encoding method that has no DC component (eg, Manchester).

The stream will be coded as -1, 1, not 0, 1. The idle value will be 0. There will be enough time between the frames for the sound card output capacitor to discharge to 0.

> Same question goes for the envelope control channel - is the envelope switching information conveyed by presence/absence of an audio tone, or is it encoded in some data format?

Analog, modulated at a high tone. It shall be rectified at the TRX and direct modulate the PA. But I will try first to do just with on/off keying. It shall be good enough for low power PSK31. MFSK16 and Olivia at low speeds shall be good enough with constant envelope. No need to hardware modify ATS-3.

> The idea of a separate audio channel to control envelope switching puzzles me. Why doesn't the local processor, knowing which mode it's in, just set the carrier phase/frequency, ramp the carrier on according to the prescribed turn-on function, turn the carrier off according the same function, set the phase/frequency for the next symbol, etc?

Because I hate programming firmware and I want to keep the firmware as simple as possible. I do not want to program modes into the firmware, but to maintain it at the master computer, which is much easier. The other HAMs will not need to flash firmware when there is a new mode. If someone creates a new TRX for digital modes, I do not expect most

of the HAMs to be excited about buying a programmer to be able to work a new mode.

> Also, the above sequence could just as well be sent over an async serial channel such as a COM port.

Serial port is controlled by the windows or linux driver. There is no guarantee that the bytes are sent exactly at the instant the program sends them to the driver. There is no way for the terminal program to control the data timing. The firmware will have to cache the commands and clock them. This is not needed with the sound card stream.

>capacitor to discharge to 0.

This sounds like the old "return to zero" data format. Can you guarantee that a "1" sent to the sound card comes out as "1" and not a "-1", ie, is phase preserved or could there be a possible phase reversal? What's the longest time the data could be in the "1" or "-1" state? Droop in the coupling caps could be an issue if the time is long compared to the low frequency response time of the card's amplifiers.

==========
>Analog, modulated at a high tone. It shall be rectified at the TRX and
>direct modulate the PA.

Charge and discharge times will need to be very fast

==========
>Because I hate programming firmware and I want to keep the firmware as
>simple as possible.

This imposes more of a burden on the hardware. That's even worse

From: dave
Topic: 966 Message: 966

Belatedly getting around to building the ATS-3 (not 3A) that I've had here for a year or two. Got all the SMT stuff mounted and ready to wind L6.

In the kit are two different types of magnet wire, a heavier red coated wire and a lighter gauge brown coated wire. Wondering which the designer intended to use for which toroids.

I'm assuming that since L6 carries a fair amount of current, it should be wound with the heavier wire.

Am I simply overlooking the instructions for which wire was to be used on which toroids? Where is the lighter gauge wire used?

I searched the archives and do not find this mentioned anywhere.

Steve,

Thanks for reprogramming my MEGA48 chip for my QBSA! I'm delighted to report that the jerky, delayed frequency updates on my display are history, and the QBSA now responds quickly to frequency changes from the ATS-3A on all bands.

I can't believe how fast you fixed this bug, or how quickly you returned my updated chip. This kind of service is rare these days.

For those who may wonder, the QBSA still operates with the MEGA48 chip removed - only the display doesn't work. I thought twice before I tried this. It's cool to have this thing fully functional!

72/73 and thanks again!

968. Re: ATS3 and portable digital modes

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-14 07:52:17 UTC
From: jgaffke
Topic: 905 Message: 968

Howdy All,

I'm interested in implementing PSK31 on the ATS3A. This mode seems most in line with low power operation using a minimum of equipment. I think we should be able to shoehorn an entire PSK31 station into that Altoids tin, running it all on the MSP430. It may be that the only hardware mod required is that of substituting in the 28 pin MSP430F1232 as described below.

I started a thread than ran Oct/Nov 2006 on the qrp-l list titled "PSK31 on a uC". I've now posted C code for the decoder algorithm described in that thread, look for KE7ER_pskuc.c in our files section. Should compile with most any C compler under 40 years old, takes no input, and output is all printf's to the console. Simulates 10 bit 4 KHz audio sampling of a PSK31 transmission coming in at 500 Hz while a competing PSK31 station at 4 times the power sweeps through from 400 to 600 Hz. Does it with 16 bit adds and shifts. With 32 bit arithmetic, it can handle over 24 bits per sample.

Monitoring receiver audio plus a switchable 500 Hz reference should be sufficient to replace the waterfall display. The firmware would have special hunt and fine tuning enhancements, and once locked the algorithm nudges the DDS to follow signal drift.

I expect transmission to be easy. For truly portable operation, the operater could use the Morse paddle to key in a message, the MSP430 converts to Varicode and twiddles register bits in the DDS to flip the phase of the transmitted RF appropriately. Use of canned messages from flash will speed things up. Received messages could be queued up in flash while slowly spilling out through the headphones as Morse. Those impatient with Morse reception could mount one of the 2x16 displays with UART from sparkfun.com on the lid, or wait for eInk displays to hit the surplus market.

>I want to extend ATS3 firmware and use the keyer socket as a serial line ...
>73, Vojtech OK1IAK

I'd like to have firmware support for a UART link in/out of the MSP430 via the key jack (or perhaps a dedicated UART jack). This would allow us to type up traffic on a laptop or folding keyboard for transmission (either live, stored on the laptop, or stored in MSP430 flash), log incomming traffic, control the rig, and download new scraps of firmware. The CMOS3.3v to RS232 level shifters could be hidden in the DB9 shell of the phone-plug-to-DB9 cable assembly, no hardware mods to the ATS3A. Converters from USB and bluetooth to RS232 are available.

But an external laptop or keyboard is not required for basic PSK31 operation.

Given the similar baud rates, a good key click filter for CW should work fine for suppressing dirt during PSK transmissions as well, assuming the MSP430 keys the transmitter on and off at appropriate times. With identical keying envelopes, I'd expect clicks on PSK31 transitions to be as bad as CW at twice the power, since PSK inverts the RF waveform with each zero sent. But we need to reduce output power anyway or PSK's continuous duty will smoke the finals. Reducing power also gives a better keying envelope (should probably fix that), as noted by KX0R in the files section. Fair enough if we are limited to half the peak power of CW, we buy that back at the decoder when we can compare 1 vs -1 instead of CW's 1 vs 0. Of course everyone you contact will be staring at your signal in their waterfall display, full of advice on how to clean things up by adjusting your sound card and mike gain.

Though the current key click filter may be good enough for PSK31, we could give the MSP430 more control of the keying envelope. Think of Q4 as a linear voltage regulator feeding the top of L3, the R/C key click filter determines our (often changing) requirements for the output voltage of this regulator. Now replace Q4 with a buck mode switching regulator, and use an op amp adder to subtract the desired output voltage from the actual output of the switcher, sending the result to the switcher's feedback pin. The "desired voltage" would come from a D2A controlled by the MSP430 over the SPI bus (or from a PWM pin), the MSP430 does table lookups of a half cosine wave to determine what to feed the D2A. A buck-boost switcher would be more flexible, but buck mode is safer since the worst it can do is Vbatt into the final.

A stingier approach might be to remove the key click filter caps so Q4 switches instantly, then drive Q3 with 100 KHz PWM from the MSP430's counter/timer. Add a coil, cap, and schottky diode between Q4 and L3 to complete a buck regulator. Might run open loop if constant antenna impedance is assumed (after calibrating at tuneup), or could close the loop by feeding our switcher's output voltage to an A2D on the MSP430.

In any case, the switcher can be completely shut down during recieve to avoid hash. In addition to better envelope shaping, the switcher would add the abililty to efficiently cut peak power when conditions allow, on both CW and PSK31.

Regarding the Medfer Beacon mentioned by W3JDR, that modulator appears to be linear. But it is a good example of PWM from a uC counter/timer being used for envelope shaping.

We will need something more than the current 20 pin MSP430F1121A. Perhaps replacing it with the 28 pin MSP430F1232 is sufficient, the extra 8 pins hanging over mylar tape we add to cover the pushbutton pads (dremel down any protruding pins first, and move C51). The

pinout for the top 20 pins remains identical, so existing firmware should work with no changes. The new part gives us more RAM, more flash, and a 10 bit A2D. Could dead bug an SPI A2D if we want more bits, though the file posted shows impressive results from just 10 bits. Add a wire from received audio to the A2D input plus an RC low pass filter for a DC reference, and the rest is all a matter of firmware.

>YES! Please keep it on list. I for one am interested in the discussion.
>-mike/w1mt

Oh good. ;)

>As I said in a previous email, I was already working on an
>"enhancement" daughter board that would plug into the ATS
>programming header in order ...
>Joe W3JDR

A common way of hooking in a daughterboard would enable lots of experimentation without trashing rigs. I'd use the ATS3A's JTAG and RPAK through-holes to mount the daughterboard, we still need a common but flexible way of bringing in a few more signals like RX_Audio, DDS_LO, T/R, and VBatt. Some electrolytics on the main board could first be replaced with physically smaller chip ceramics, and the RPAK remounted with clipped pins after a socket strip is installed in its position. My daughterboard might include the newer TSSOP-38 MSP430F2274 plus a few peripherals such as a MByte of SPI flash, 20 bit A2D, SWR sensor, SCP1000, beefy final, switcher for that final, digital pot for volume, LiPo charger, ... But without sucking power? As Joe suggests, removing the daughterboard restores stock operation by releasing the old MSP430 RESET line. Normally mount the daughterboard on the exposed side of the main board, but a low profile daughterboard could mount on the button side if it has switches and lights for the front panel. If any features actually work out, we can lobby Steve to roll them into the next main board.

OK, that should be plenty for a first post.

A common way of hooking in a daughterboard would enable lots of experimentation without trashing rigs. I'd use the ATS3A's JTAG and RPAK through-holes to mount the daughterboard, we still need a common but flexible way of bringing in a few more signals like RX_Audio, DDS_LO, T/R, and VBatt. Some electrolytics on the main board could first be replaced with physically smaller chip ceramics, and the RPAK remounted with clipped pins after a socket strip is installed in its position. My daughterboard might include the newer TSSOP-38 MSP430F2274 plus a few peripherals such as a MByte of SPI flash, 20 bit A2D, SWR sensor, SCP1000, beefy final, switcher for that final, digital pot for volume, LiPo charger, ... But without sucking power? As Joe suggests, removing the daughterboard restores stock operation by releasing the old MSP430 RESET line. Normally mount the daughterboard on the exposed side of the main board, but a low profile daughterboard could mount on the button side if it has switches and lights for the front panel. If any features actually work out, we can lobby Steve to roll them into the next main board.

OK, that should be plenty for a first post.

Yes Dave, use the heavier wire for L6. Looking through my copies of the manual, I don't see specific instructions regarding the wire gauges, except on the page for the filter boards. There, the chart for the filters shows #24ga for L1/2 in the 80M column. This should be the same for all the filter boards.

I built my ATS3 a long time ago, I don't know if changes to the specific wire Steve included took place in later kittings, but all my filter boards are wound with red enameled wire. They all appear to be of the same gauge as well. If you only have a relatively small amount of the larger gauge- then that is for the RFC, L6 only. I suspect rest of the filter toroids should be wound with the smaller wire.

Bruce,

Thanks for the note. After thinking about it overnite I decided that the finer gauge wire was most likely for the high count toroids for the 80m board. After a more careful look at the filter board instruction sheet I see the notes about wire gauge there . . . duh . . .

Unfortunately it looks like those notes are printed with a color background. My laser printer prints those backgrounds as nearly black, making it tough to see that one note says #28 and the others say #26. Might be better to simply outline or bold or italic those notes rather than use a colored background. Not everyone has a color printer.

At any rate thanks for your help - got me going the right direction.

Hi Jerry.

I read the thread at QRP-L. Just one remark to the old conversation. Accumulating PSK changes over 1 second may be contraproductive, because the ionosphere modulates phase of the signal slowly. In some cases it is better to actually increase symbol rate from 31 to 63 to make the phase changes bigger than what ionosphere does. Multitone modes like MFSK16 or Olivia are much better if the ionosphere is not that close to an additional gaussian noise only.

I wonder how easy it would be to "zero beat" a PSK31 signal to an aux 500Hz tone with the precission of 10Hz. I am affraid that the ones without musical ears will not be able to do that. I propose to extend your program to simulate it and ask couple of friends to try to tune into real signals.

I agree with all in your last message. Everything that you described is certainly feasible. It only needs to be done. While I love revolution, I think that for a hobby project a slow evolution is more feasible. My time is constrained and my goals must be constrained as well. And I aside of the digimode ATS-3 project I have the PocketDigi project to maintain and improve.

I decided to only extend the original firmware of the original ATS-3 to allow modulation of digital modes over serial line. | plan to make the firmware extensions as simple as possible and to keep the complexity at the PC or Pocket PC side. I do not plan to substitute the original microprocessor. I do not plan to modify the PA or add AM modulation of the PA either. To easy the PA I will run the whole transceiver from 6V.

I hope to get the ATS next week, to build the paralell programmer and tinker the firmware a bit soon. In the meantime I read tutorials to MSP430.

If that works, I am open to other evoĺution. I will not help you guys now with developing a new hardware and writing a standalone PSK31 implementation, but I will keep my fingers crossed for you.

> I've now posted C code for the decoder algorithm
> described in that thread, look for KE7ER_pskuc.c in our files section.

I will certainly look at this source code.

> My daughterboard might include the newer TSSOP-38
> MSP430F2274 plus a few peripherals such as a MByte of SPI flash, 20
> bit A2D, SWR sensor, SCP1000, beefy final, switcher for that final,
> digital pot for volume, LiPo charger, ... But without sucking power?

I strongly advocate to keep the hardware simple. I could believe that lot of HAMs develop just for fun and do not mind that only a single prototype of their fine engineering art will be ever built. But I am not one of them and if I invest my time into developing something just for fun. I want it to be duplicated.

This is a lesson I learned last years. My friend Petr OK1XGL developed a fine QRP transceiver of the size of Elecraft K1, with CMOS mixer, extremly high IP3. The transceiver is small, nice, but very complex. If it is not kitted, nobody will ever reproduce it.

I wrote PocketDigi and advocate Pocket PC handhelds for portable digital modes. The device is easy to program, quite cheap and versatile. If you want to build something similar, you will very soon exceed the price of a second hand Pocket PC. And if a software is written for Pocket PC, hundreds of HAMs will certainly use it.

A relatively short one this time.

I created folder KE7ER in the files section, moved pskuc.c
into the folder as there may be related material accumulating.
Made minor fixes to some of the comments in pskuc.c,
code remains the same.

From my post yesterday regarding the PSK31 decoder algorithm:
>replacing it with the 28 pin MSP430F1232..new part gives us more RAM
The MSP430F1232 is still at 256 bytes, should be OK

In file pskuc.c:
>sends alternating ones and zeros (Varicode spaces)
No, not spaces, that would be 001001001...

Joe wrote:
>Take a look at the block diagram for my enhancement board that I

>Joe W3JDR

Most digital modes take much more processing power than the MSP430
has to offer, something like your approach would be required to
implement them. I'm picking off one of the easiest, PSK31.
I think we could have usable PSK31 with a relatively minor
hardware mod to the ATS3A, that of substituting in that 28 pin
MSP430F1232. Once that works (or not), I might look at
daughterboards to extend the capabilites further.

When you build a daughterboard, make it as generic and flexible as
you can in how it mates to the ATS3A. It will be hard to build
one daughterboard that does everything everyone wants over the next
few years. It would be very useful to be able to swap daughterboards
without having to bring out the Xacto knife and soldering iron.

Good point. Sounds right.
A slow FSK decoder should be easy enough on the MSP430.
Guess it has to track phase mid-bit, do-able but unfortunate.

>I wonder how easy it would be to "zero beat" a PSK31 signal

I think we can just point the rig nearby and have it slowly
adjust the DDS frequency till it finds something it locks to.

> > My daughterboard might include ....
> I strongly advocate to keep the hardware simple.

My first step is to see if I can get PSK31 running standalone
with no hardware mods other than that 28 pin MSP430F1232
substituted in. No daughterboard required. But it is compelling
to think about playing with some of those toys.

It sounds like we have 3 different simultaneous approaches to acomplish similar but somewhat personalized goals. I think this is great, as the odds are that something useful will probably come of it.

For my part, I will continue to develop an open hardware platform, taking the great suggestions already made into consideration. My expectation (hope?) is that others will develop enhanced firmware once the enhanced hardware is available..

Let's keep the dialog going.

You might be able to use the msp430f1132. The only thing you loose over the msp430f1232 is the extra gpio pins. Flash and ram and 10-bit sar are the same, plus the pin out is a one for one direct replacement for the current msp430f1121a.

Might be I missed something but I think this should give you the extra program space you will need. With minimal hardware changing...

You might want to wait for Steve's next project. I missed out
on the ATS-3 and just monitored the group and his webpage.
Eventually something different will evolve. Why he doesn't
do a bigger run escapes me but I suspect he might have been stuck
with leftover kits in the past. Can't blame him for not wanting to
lose money.

Sort of like the Linux Torvalds of Linux fame.:-)

In that regard he might be a bit more comfortable in expanding
the numbers of kits he orders. I suspect he is constrained by
price/quantity ranges by his board suppliers. Parts are probably
not that difficult. One of the major issues of the equation is
putting the kits/documentation together for shipping. I see alot of
labor there.

Hi Mike,

We need at least one pin for rx audio into that A2D for
standalone PSK31 operation, and the 20 pin MSP430F1121A
already has a full boat.

Could buy some of those 20 pins back with hardware hacks,
but then old firmware no longer works. And even if you did
come up with 3 or 4 pins, I can see plenty of reasons we might
want even more pins later for stuff like an SPI A2D for better
dynamic range, SPI flash for message memory (incoming and outgoing),
DC ref for the rx audio A2D (else maintain running average in
firmware?), dedicated UART port for optional laptop control when
operating CW, SWR monitor, Vojtech's battery monitor ...

Each of these mods is fairly trivial, maybe one dead bug'ed SOIC8.
Once you remove the old MSP430F1121A, it is almost as easy to
replace it with a 28 pin part as it is a 20 pin part. Pins 1-10
map exactly and old pins 11-20 map to 19-28 on the new part.
Just lift those new 8 pins up a bit, or put tape under them.
Same firmware. TI actually thought ahead on that one.

>You might be able to use the msp430f1132. The only thing you loose
>over the msp430f1232 is the extra gpio pins. Flash and ram and 10-bit

####################
>...please consider adding battery monitor.
>73, Vojtech OK1IAK

The A2D on the MSP430F1232 supports multiple channels. So could
occasionally (perhaps at end of each dot, dash, or psk31 tx run,
and when that menu item is selected to get the rx current) check a
pin for Vbat. Mod required involves two scaling resistors and a wire.
Maintain a record of max and min seen over the last minute or so.
Report those max and mins via Morse when a menu item is selected.

Two of the existing gpio ports are only used during
boot to check for the presence of the filter board.
Perhaps one (or both) could be dual used? Maybe not,
hmmmm. Anyway, you are correct in that the current
mpu is full, port wise.

Hi Mike,

I've thought of cutting the ground straps on the filter modules,
replacing them with 10K's so we can use them for other stuff
after power up.

Or going down to one band-select wire with a different resistor
on each filter module, measuring the voltage with that new A2D.
(bonus: a spare pin into the band modueles)

Or scan the four button wires somehow using SCLK and SDATA
(with FSYNC false so the DDS is not disturbed),
then only one input pin is required for the four buttons.

The hardest thing about the 28 pin part is getting the 20 pin part
off without destroying pads. Not worried about my board, I bent
those pins down before I first installed it, so it will be easy
to pick them up one at a time. Bought my MSP430F1232 at the same
time I sent Steve the check for an ATS3A last June. This project
has been on the back burner for a long time.

I think the best thing for most others to do would be to park the
new MSP430F1232 right on the back of the MSP430F1121A. All 20 pins
are common except RESET, which gets grounded on the old chip.
Also the two XTAL pins, lifted on the new part so we can park a
100KHz crystal there, cuz we'll need an interrupt that is 4KHz
dead on. Easily reversible. No pads ripped up.
I'll try that first, see if the old MSP4301232 interferes in any way.

Jerry

Thanks.

I have not been able to get an internet conection up and running for
a few days. I will dertainly take a look the options of the filters
you suggest as I am aware of the broadcast station problems on 40m in
EU having run a rockmite on 40m.

If I were to use the MSP430F1221 chip with 8 ch A/D in the "3B" version of the ATS, I could have as many as 5 unused ports available. It also doubles the memory.

Switches would now use one A/D channel and switched resistor divider. Mute would double as band select inputs, by using R dividers on the band modules. After the band module votage is read, the port would be reconfigured as an output to drive the mute switch.

2 of the unused ports could be used for serial com and a 3d for audio A/D input, leaving an extra 2 ports uncommited.

I might also put an op amp in the Tx keying ciruit to make a linear keying ramp voltage.

I imagine these changes would help alot with trying to make it do PSK?

"3B"? That's a happy thought!
I don't see an MSP430F1221, I'll assume the MSP430F1132. 256 RAM, 8KB
flash.

Using the A/D on the band select input, plus mute, seems good.
Only gets read once at reset.

Using the A/D on the switches would work, but could get in the way on
a design that is constantly being tinkered with by many people.
Can't just interrupt on a key press, the A/D has to be actively watching.
A little bit ugly having to read multiple times to avoid catching
transitions.
These are not killer objections.

An A2D would definitely help. ;)
And I suspect a linear ramp would work great.
UART is nice, would there be a separate connector to the outside?
That switcher thing would be fun to play with, but perhaps best left off
when hundreds of kit builders are debugging these with their bare hands.
Think about the DC reference into that A/D. Any error there will
throw off the algorithm. Would be nice to avoid computing it with
firmware. So we may want another pin for DC offset.
Does AGC action jerk the DC offset around, even a little bit?

It's really frustrating to look at the newer MSP430F2*** family.
They run twice as fast, and have lower power for comparable performance.
Have a UART bootstrap loader in ROM that removes the need for JTAG
http://focus.ti.com/lit/an/slaa089d/slaa089d.pdf
The power-on-reset is now done right, using a comparator with hysterisis.
Added pullups on the GPIO's, may do away with the RPAK.
I would like an SOIC-28 part with 16 bit A/D, they don't have anything
near.
The nice 16 bit A/D's are in 14 pin parts, next stop if you want an
A/D is
a 10 bit SAR in a TSSOP-38.

Given the freed up JTAG pins, 14 pins almost does it. But you're
down to 128 bytes of RAM. Gaaaa!

I'd look hard at the MSP430F2232-TSSOP38. Their 1K pricing shows a 7%
price
jump over the MSP430F1132. 512 RAM, 8K of flash. Those with big bucks
and dreams of running CPM again can opt for the pin compatable
MSP430F2274, 1K RAM + 32K flash, Digikey sells it.

Pads are free. Primary cost might be the postage for all those cold
solder
joints getting shipped back to Steve. Pins on that TSSOP38 are same
dimensions as the DDS chip, just a few more of them. And they don't
all have to be soldered down. It's as long as the current SOIC20, not
quite
as wide. Is that DDS part especially troublesome, or are soldering
problems
spread across a wide variety of parts? Perhaps someone could provide an
optional service of mounting troublesome parts.

Maybe what was the JTAG and RPAK could become a daughterboard connector
for specials.

I don't know yet how usable a 10 bit A/D will be in the real world.
Maybe a daughterboard could be used for an SPI A/D by those with
more than a casual interest in PSK31.

Don't assume I know what I'm doing here. Most of my operating was 40
meter
CW some 30 years ago. And not much of it then. Have yet to even
watch someone operate PSK31. But it's a very interesting puzzle.

That said, the example program I posted has a 500 Hz PSK signal plus a
QRM
component at twice the amplitude (4x the power). With the C constant
"scale"
at the default of 1.0, the samples run from +511 to -511. If the
samples are
clipped to 511,-511 (not done in the program posted), it continues
working
to a "scale" of 3.3. And to a minimum "scale" of 0.0022. Thats a

voltage ratio of minimum usable signal to maximum usable signal of 1500,
which left me dumbfounded. When "scale" is set to 0.0022, the samples
coming out of the simulated 10 bit A/D are all 1, 0, and -1.
And at 3.3, the vast majority of samples peg the A/D.
Did I mention that all this includes a QRM component at 4x the power?

The MSP430 A/D allows us to adjust the gain, and thus give us
additonal AGC
if we want it. But all that AGC could well get us into hot water.

What dynamic range must the signal into the uC handle to be useful
for weak and strong signals comparable to what folks expect from their
soundcard implementations, given the ATS3A's analog AGC?

####################
>>...please consider adding battery monitor.
>>73, Vojtech OK1IAK
To which I responded with:
>The A2D on the MSP430F1232 supports multiple channels. So could
>occasionally (perhaps at end of each dot, dash, or psk31 tx run, ...

Like the switch sensor using the A/D, this adds stuff that is always
going on.
Simpler to add another menu entry that works like straight key mode.
Dot keys the transmitter as if it were a straight key. Dash does nothing
to the transmitter. But on the completion of either, the rig reports
the battery
voltage via Morse.

I figured I had better double check that ratio of 1500 regarding
max vs min signal amplitudes claimed in my prevous post.

>it continues working to a "scale" of 3.3. And to a minimum
>"scale" of 0.0022. Thats a voltage ratio of minimum usable
>signal to maximum usable signal of 1500

Turns out I was not quite correct. In a curious way.

When you turn off the QRM without changing the amplitude of the
500 Hz signal, it stops working at scales below 0.0062 (not 0.0022)

The signal has to ride on top of the QRM in order to be detected
by that LSB of the A2D. The off frequency QRM somehow averages out
to zero, even though we have some very non linear sampling going
on here.

So perhaps a more honest figure would be more like 3.3/0.0062.
Of course, if we insist on measuring our dynamic range without
the QRM component present, it's going to work fine way above 3.3.

Without QRM, we start seeing all zeros at scales of 0.0058
and below. The range of 0.0058 to 0.0062 corresponds to a
region where we can catch it when sampled at 90 degrees, but not
at 67.5 degrees. This is that 7.6% penalty mentioned in the
notes toward the bottom of pskuc.c

997. Cash's solder paste and hot air smd method

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-17 20:21:07 UTC
From: nn4cw
Topic: 997 Message: 997

I received my syringes from Cash loaded with solder paste Friday. I had three projects on my agenda: KD1JV's digital dial, the ATS docking station, and a 3a kit. This morning I completed my digital dial. I ordered the larger needles per Cash's recommendation.
I was unable to find the beverage warmer, and no longer had a coffee maker with a warmer. I considered using an oil candle heater, but it would only heat to 170 F. Cash recommends a target heat of 210 F, but he says cooler will do. I decided to try an old 10.5" black cast iron skillet because of its favorable thermal mass. I have a digital cooking thermometer which reads out instantly. Having a gas range, I am able control the heat better than with an electric stove-top. With experimentation, I was able to determine how long (not long) it took to heat it to 210 F, and timed the rate of cooling, which was acceptable. The thermometer's digital read-out is on a swivel and I laid the thermometer in the pan, and supported the plastic head above the pan's surface. It remained in place during the hot air flow. I would not recommend this stove top method with a cast iron frying pan without a digital thermometer.

The learning curve for parts placement and paste application was fairly rapid for the resistors and capacitors. Cash's website is most helpful. The IC's were a little more difficult and I had to wipe the paste clean off the IC pads once and carefully remove paste from the back of the smallest IC. Having completed a digital dial a couple of weeks ago using a doofus and soldering iron, I had a benchmark to compare methods. Even with a learning curve, the parts placement was considerably quicker and less boring than one at time with the soldering iron. It took less than an hour and a quarter to populate the board, including several placement screw-ups and several paste reapplications.

I heated the pan to 215 F. I lowered the board in the pan and monitored the thermometer, when the temperature hit 205, I turned the heat on for a few seconds and the temperature went to 210 F. The paste began to flow and I applied the hot air. The paste silvered in a matter of minutes. The IC's had 4-5 bridges per IC, a resistor and cap were blown out of position. Before using solder wick on solder bridges on IC's, I've found that it is sometimes easier to lightly place my Hakko's iron's chisel point between the leads and drag the blob to the pads. It clears the bridge for me more than half the time, unless the bridge is large which then requires solder wick.
I spent a few minutes touching up with my iron and re-flowed a few pads where the solder looked a little dull. I completed the back of the board with my iron. The dial fired up without a hitch.

Each syringe is loaded with .5 ml of paste. It looks like a pitiful amount until application begins. The job required only .1 ml. I believe one syringe will easily do the job for an ATS3, but buy two just in case. You won't find this stuff at Ratshak. I've gotten fairly fast with the iron and doofus method, having built several smd projects with the most complex being a Micro908 antenna analyzer, an ATS2 and two ATS3's, but this hot air method is considerably quicker and the results look neater. It's the real deal. YMMV.

From: Larry Makoski
Topic: 998 Message: 998

This Sunday evening, the Flying Pigs Amateur Radio Club International will be holding its monthly Run For The Bacon. This is a friendly, two hour QRP CW Sprint, which is open to ALL radio amateurs, will last from 9:00 - 11:00PM EST (0200-0400 UTC Monday). So, if you're not exhausted after working DX all weekend, remember the RFTB !!!

You may work stations once per band on 160, 80, 40, 20, 15 or 10 Meters. Suggested starting frequencies are 1.812, 3.562, 7.044, 14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs membership number. If you're not a member of the Flying Pigs, and would like to be; then please click on the "membership" hyperlink on .http://www.gentzow.com/fpqrp/ Otherwise, non-members can just use their output power figure.

You can report your score via the Autolog page which can be found at :
http://gentzow.com/fpqrp/autolog.asp
or you can mail your logs to the address given on the Autolog page. The deadline for logs is February 25th at 2400 UTC.

Hope to catch you on the air Sunday evening!

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-20 09:45:56 UTC
From: Vojtěch Bubník
Topic: 905 Message: 1000

Hi Jerry.

> I created folder KE7ER in the files section, moved pskuc.c
> into the folder as there may be related material accumulating.

I looked at the source. It takes some time to get used to thinking in signals. The analysis follows of what your PSK31 decoder does IMHO. I think Patrick Lindecker - author of MultiPSK may give more precise description, he is my personal guru, hi.

1) The signal is frequency shifted to the baseband by multiplying it by a sinus running at 500Hz.

2) Every second resulting sample is thrown away, which results in 2ksamples/sec stream. If the signal has not been bandlimited to 1kHz before (either by the crystal ladder filter or by AF filtering), there will be a strong alias of signals around 1.5kHz and 2.5kHz. I wonder what the rejection of ATS-3A at 1.5kHz will be. IMHO the rejection of the crystal ladder filter is somewhere around 50dB.

3) The signal is low pass filtered by a FIR filter with a rectangle impulse response.
http://mathworld.wolfram.com/RectangleFunction.html
This corresponds to a filter with a frequency response of a sinc function
http://en.wikipedia.org/wiki/Image:Sinc_function_%28both%29.svg
The first sidelobe of the lowpass filter is -14dB at cca +-47Hz from 500kHz carrier, at -18 at +-78Hz, -20dB at +-109Hz, -26dB at +-300Hz etc.

The algorithm certainly works, it is just not ideal. A simulation on white noise, ionospheric simulator and on the air is needed.

From your source code comments:
> Next steps:
> Add a mode to the ATS3A firmware for tuning up/down in one Hz increments.
> Run the decoder algorithm on a desktop, listening to soundcard audio from the
> ATS3A.

I would be happy if you could replace PSK31 decoder in some software and compare it with other decoders by decoding signal fed through a ionospheric simulator or at least additional gausian white noise. I think you prefere linux, there is a lot of PSK31 software with source code, that may be modified.

I received the ATS-3A from Ron Pfeiffer N1ZSW today. I hope to build the parallel programmer and start tinkering with the firmware this weekend. The first test would be probably to send a precanned PSK31 message at a fixed frequency, so that other owners of ATS2 and ATS3 may try that and judge the PSK31 signal quality of a PSK31 envelope created by CW keying.

73, Vojtech OK1IAK

So "baseband" in this case is the 31.25 baud stream of ones and zeros.

>If the signal has not been bandlimited to 1kHz before (either by
the crystal ladder filter or by AF filtering), there will be a
>strong alias of signals around 1.5kHz and 2.5kHz.

The crystal filter will reject this 1500 Hz about as well as the
RF image at -500 Hz. I don't have much trouble with that -500 Hz
RF image on CW, and the audio filter isn't helping like it would with
the 1500 Hz alias.

> 3) The signal is low pass filtered by a FIR filter with a

>lowpass filter is -14dB at cca +-47Hz from 500kHz carrier, at -18
>at +-78Hz, -20dB at +-109Hz, -26dB at +-300Hz etc.

Program pskuc.c shows errors pretty much taking over when the
QRM is ~8x the amplitude, or 18dB. That agrees well with your
analysis. How much stronger can a signal 100 Hz away be
before the other popular PSK31 decoders start to fail?

>I would be happy if you could replace PSK31 decoder in some
>software and compare it with other decoders

I would too. But I'll be lucky if I find the time to just get mine
going on audio into the soundcard as previously outlined.

>I hope to build the parallel programmer ....

I have the Olimex cable as described here:
http://www.sparkfun.com/datasheets/MSP/msp430-jtag-d.pdf
A very good deal at around 15 US$. If you are building your own,
all the stuff around U1, U3 and T1 could probably be done away with,
just make sure the outgoing buffer has a Vcc that matches the 3.3v
of the MSP430. If I ever get around to using it, will post my
notes on exactly what is needed of the circuitry they include

and how to hook it up.

If there is going to be a "3B", and it is going to be full featured. How about a biult in tuner. or even an external tuner. i have been wanting to build an electronicly controled tunner but i have no experiance in programing pics and things like that. i just built a tuner from the arrl handbook on a qrp scall. it is the one that uses a pi type low pass configuration. it is for balanced antenna to unbalanced 50 ohm. the balun is on the rig side and this works very well. the loss is only .2 watts!

Hi,

yes, that is what missing to me in AST-3A only. The pb is that if tunner will be incl. that has to be completed with SWR meter fully controlled by PIC inside of ATS. If ATS-3B will have all the features as mentioned inlc. some built-in tuner (something like K1 or so) this tcvr will be the best in the world for me !!! ...as not needed anything more just batt., antenna all in size of t-shirt.

Hi Mark,

Periodically post but monitor Steve's site for when he gets something new. I bet the next rendition will be great. I have to wait over 6 months for the 3A to come out.

Thanks, Kurt. I do watch Steve's website, but I also have specific reasons for wanting a '3A. I remain hopeful I'll be able to find one. (Just missed TWO of them offered on QRP-L a couple days ago due to a regretable comedy of errors on my part. Very disappointing!)

Cheers,

There will be NO built in tuner. There are a number of resons for this.

1. What type of tuner you use depends on what type of antenna your using.

If your using a classic dipole, you don't need a tuner. Portable verticals
may or may not need a tuner.

End feed antennas need radically different values in the tuner depending on
if its near 1/2 wave long or is much shorter than 1/2 wave.

Balanced line feed antennas need thier own unique type of tuner.

We can't make one type of tuner which will cover all types of antennas, so
I feel its best to let the individual user decide which, if any, type of
tuner best serves thier needs.

2. The Elecraft T1 tuner is about as small as an auto tuner can get. I
can't make one any smaller or less expensively.

i just looked at the Elecraft T1 tuner. Are those miniture relays in the unit? I would think transistors would work better and be less expensive?

Chris,
They're latching relays, so they only draw current for an instant when they switch.

Transistors and pin diodes aren't up to the job, as the RF currents and RF voltages in the circuit can become quite high depending on the load and how the tuner is set.

Latching relays really are the best choice, but they're expensive.

Joe

Steve,

Thanks! I have a T1 and agree. It's an amazing autotuner. It's
incredibly small, for what it does, but it's still larger than my ATS-

3A. For trail use the ATS-3A into a dipole may be just fine - a small balun might be of some value. For multiband operation with one balanced antenna, the BLT is hard to beat. I have built three BLT's now, for different frequency ranges, and they're very effective. My tests show them to have very low loss into reasonable loads.

The tuner question is highly personal and depends on the operator and what kind of operation he likes. I think that there is room for experimenting with portable tuners smaller than the T1 and the BLT. Networks for one band might fit into a cubic inch or two and still work OK.

The reality is that the ATS-3A is absurdly small, and a full-size portable dipole and feedline made of halfway durable materials will weigh more and take up more space in your pack than the rig! If you bring along any tools to put up your antenna - fishing pole, tennis ball, slingshot, throwline, portable mast, whatever - these will be much larger and heavier than the rig, tuner, etc.

After reading all the recent posts here about PSK and digital modes, Steve, I hope you're not swayed too much. Maybe there should be a dedicated radio for portable PSK, and that would be useful and cool; it might catch on and create demand - but adapting the ATS-3A for this seems a bit much - it's already customized so well for portable CW.

In a year or two, when the sunspot numbers rise, and 15M and then higher bands start opening up regularly for DX with low path losses, it would be way cool to have a tiny, efficient radio that would operate up through at least 10M. During the solar maximum in 1981 I played a game calling J's on 10 meters with an attic antenna - I would reduce the power of my homebrew tube rig to 1 or 2 watts and call those guys just to see if they'd come back. Of course, they almost always came back! If I had a rig like the ATS-3A for 10 meters, I could go up hills and mountains with a little fiberglass pole and a dipole, and work people all over the world easily. When we emerge from solar minimum, we're going to be very frustrated if 20 meters is our shortest wavelength. The scientists at NCAR predict that the next solar maximum will be much better than the last, and that's great news if you like 10 and 12 meters! Having SSB in a tiny portable radio would be cool too, although having both CW and SSW in one unit creates challenges.

Steve, having higher frequencies is my wish for a future rig. Solar minimum will not last all that much longer - a couple more years maybe.

If you were in this for profit and volume, you could post a survey and ask your customers what they would like. Then you could take the results of this marketing research back to your design lab and go from there. But...

I think some of the loudest voices on here lately don't represent the "silent majority" of us who think the ATS series is a really cool portable CW radio. Steve, you've created a nice group of loyal operators/customers - please create just what you want, because it's your fun and creativity that makes this whole thing so cool.

Thanks
KX0R

The Elecraft T1 has a bunch of tiny latching relays, and they draw a
few milliamps for a few seconds while the processor finds a match;
after that they draw no current. The T1 runs well on a 9V battery.
If you want a tiny auto tuner, this is a nice one; remember that the
output is unbalanced. If you want balanced output and add a balun,
cable, and connectors, the combination is larger than a balanced
tuner like a BLT, which costs much less.

I agree on the issue of the digital modes. It would be better to build a digital mode radio from the ground up.

Just an idea, what about an SDR QRP digital mode radio? Imagine just 3 connections, a mini-USB to a computer, an antenna connector and power. Let the software do the rest. With SMT and minimal parts count, it could be a tiny radio.

Unfortunately I do not have anywhere near the technical knowledge (or time) to tackle such a project, but would love to be a part of it!

May be somewhat off topic on the ATS list, but the thread got me thinking.

Rick

It is unfortunate that there is not a solid state solution to this type of switching. On the other hand, there are some distinct advantages to the latching relays. And the clickety-clack of the relays is kind of a pleasing sound - you know right away the tuner is doing something.

I have been thinking the T1 would be a good match for the ATS-3. About 1/3 of the enclosure space in it is for a battery. If one were to combine the ATS and the T1 and use a common power source, you could still have a very small package.

Of course as Steve pointed out, a resonant dipole is a great answer. There is a lot to be said for the utter simplicity and dipoles are great performers (my personal favorite).

Chris,
They're latching relays, so they only draw current for an instant when they switch.

Transistors and pin diodes aren't up to the job, as the RF currents and RF voltages in the circuit can become quite high depending on the load and how the tuner is set.

Latching relays really are the best choice, but they're expensive.

Joe

i just looked at the Elecraft T1 tuner. Are those miniture relays in
the unit? I would think transistors would work better and be less
expensive?

Hi Carey,

Steve said he was looking at making pins available on the MSP430
for an A2D and UART, and improving the key click filter.

There may not need to be any extra parts to allow PSK31 operation.
Everything he suggested would also pertain to CW operation.

Moving to an MSP430 with A2D would make things like a battery
monitor or SWR indicator possible.

If the UART is for PSK31 only, might as well use the key jack.
The RS232 level shifters could be in some optional cable assembly.
But a UART might also be useful for CW operations, allowing a
handheld computer to be used as a front panel to control the rig.
Or used to replace the current JTAG pins, if an MSP430F2*** is used.

The current key click filter should be looked into, as your
notes in the files section suggest.

I suspect improving CW operations will remain the primary objective
in the design of any "3B".

Well, it is possible to design much better FIR filter than the rectangle one, most of the soundcard decoders will perform better at these conditions. I am not sure how often this situation appears in the real life though.

It may be interesting to try to design CPU efficient lowpass FIR filter using bit shifts, additions and subtractions. Just use some software for generating FIR filters, substitute the coefficients by the nearest bit shift and do the FFT analysis of the resulting filter.

Richard,

Any solid state solution using PIN diodes would consume lots of power and PIN diodes for the HF range are not common these days. Latching relays are the most cost effective and power effective solution for a low power auto tuner.

You wanted a portable QRP tuner with a built-in tuner? Have you considered the Elecraft KX1?

Mike N2MS

<snip>-------------- Original message --------------
From: "Richard Bennett" <kc0pet@...>

It is unfortunate that there is not a solid state solution to this type of switching. On the other hand, there are some distinct advantages to the latching relays. And the clickety-clack of the relays is kind of a pleasing s

Hi Vojtich,

At 500 Hz, we're parked at one end of the ATS3A passband.
Assuming 100 Hz signal spacing, there might be two other
signals to deal with. That's a bit different than feeding an
entire SSB passband into a soundcard.

A quick fix to deal with a bothersome signal (at least on the
lower bands) would be to switch the DDS frequency used on receive
over to the other side of the IF frequency.

Non-rectangular coefficients increase the workload quickly.
The dynamic range and selectivity we are now seeing with pskuc.c
might be sufficient, but it would be interesting to see how much
further the MSP430 can take this.

Steve,

Thanks! I have a T1 and agree. It's an amazing autotuner. It's incredibly small, for what it does, but it's still larger than my ATS-3A. For trail use the ATS-3A into a dipole may be just fine - a small balun might be of some value. For multiband operation with one balanced antenna, the BLT is hard to beat. I have built three BLT's now, for different frequency ranges, and they're very effective. My tests show them to have very low loss into reasonable loads.

The tuner question is highly personal and depends on the operator and what kind of operation he likes. I think that there is room for experimenting with portable tuners smaller than the T1 and the BLT. Networks for one band might fit into a cubic inch or two and still work OK.

The reality is that the ATS-3A is absurdly small, and a full-size portable dipole and feedline made of halfway durable materials will weigh more and take up more space in your pack than the rig! If you bring along any tools to put up your antenna - fishing pole, tennis ball, slingshot, throwline, portable mast, whatever - these will be much larger and heavier than the rig, tuner, etc.

After reading all the recent posts here about PSK and digital modes, Steve, I hope you're not swayed too much. Maybe there should be a dedicated radio for portable PSK, and that would be useful and cool; it might catch on and create demand - but adapting the ATS-3A for this seems a bit much - it's already customized so well for portable CW.

In a year or two, when the sunspot numbers rise, and 15M and then higher bands start opening up regularly for DX with low path losses, it would be way cool to have a tiny, efficient radio that would operate up through at least 10M. During the solar maximum in 1981 I played a game calling J's on 10 meters with an attic antenna - I would reduce the power of my homebrew tube rig to 1 or 2 watts and call those guys just to see if they'd come back. Of course, they almost always came back! If I had a rig like the ATS-3A for 10 meters, I could go up hills and mountains with a little fiberglass pole and a dipole, and work people all over the world easily. When we emerge from solar minimum, we're going to be very frustrated if 20 meters is our shortest wavelength. The scientists at NCAR predict

that the next solar maximum will be much better than the last, and that's great news if you like 10 and 12 meters! Having SSB in a tiny portable radio would be cool too, although having both CW and SSW in one unit creates challenges.

Steve, having higher frequencies is my wish for a future rig. Solar minimum will not last all that much longer - a couple more years maybe.

If you were in this for profit and volume, you could post a survey and ask your customers what they would like. Then you could take the results of this marketing research back to your design lab and go from there. But...

I think some of the loudest voices on here lately don't represent the "silent majority" of us who think the ATS series is a really cool portable CW radio. Steve, you've created a nice group of loyal operators/customers - please create just what you want, because it's your fun and creativity that makes this whole thing so cool.

Thanks

That's 18dB when the QRM is 200 Hz away, not the 100 Hz I was suggesting. At 100 Hz separation, see errors take over at around 9dB. Not sure how "errors taking over" fits in with your analysis.

I have the T1 auto tuner and it's VERY nice. Steve is right you can't do
better for a QRP radio. But there's a problem with this tuner when your
using an ATS3. While the tuner is tuning it gives some weird impedance
to my ATS3 transmitter and when it hits a critical point the ATS3
re-boots. This is 100% repeatable.

I built a in-line 25 ohm resistor that fixes this problem. But it's a
pain to put in and take out every time. But it does give you a perfect
match to my portable antenna which is 85 feet end fed with 2 conterpoise
wires.

1022. My ATS-3 is nearing completion

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-24 19:01:24 UTC
From: Jeff - JWID
Topic: 1022 Message: 1022

Well ...

After a long time of having little spare time, I managed to piece together a couple hours this week. I have the case all painted (deep green) and have just finished soldering all of the surface mount components. Not as hard as it was made out to be, and it LOOKS as though all the parts are soldered correctly. Time will tell ...

Now to start the thru-hole parts tonight, and print the decals for the case.

From: dave
Topic: 1023 Message: 1023

A new ATS-3 took to the airways tonite. Finally completed the kit
that has been here for about 2 years. Worth the wait though . . .

First contact was on 40m with LZ4UU calling 'CQ test' from Bulgaria.
Unfortunately I fumble-butted my call and was not able to correct it
so that Q goes to someone else . . .

But *I* know I made it even if it never shows up in the contest log.

Then chatted with KE2EB in NC and K1OV (qrp/qrp) in CT (my qth is near
Mobile, AL). All on 40m. Seems to be a good little rig. Think I
will enjoy using it.

Have enjoyed reading all the informative posts on here. Keep up the
FB work!

1024. ATS-3B progress

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-25 20:20:08 UTC
From: Steven Weber
Topic: 905 Message: 1024

I've decided to make only minimual changes to the -3A to migrate it to the -3B. The primary change will be to add 17 and 15 meters as standard. Limiting it to 15 meters will keep the rig current reasonable. The current starts to get pretty high if we push it to cover 10 meters.

Adding two bands and keeping the rig so it automatically detects each band module requires changing how the band modules are read by the processor. To do this, the processor reads a voltage from the band module, created by a voltage divider comprised of one of the 47K pull up resistors and a unique resistor value on each band module. Rather than using the more expensive processor with A2D converter, I implemented a simple slope A/D converter with the comparator in the F1121A.

It works by measuring the time it takes to charge a capacitor to 1/2 the processor supply voltage, as generated by the internal voltage reference. The capacitor is then discharged back to 0 volts and then measures the time it takes for the cap to charge up to the voltage generated by the band module resistor divider, which is always less than 1/2 the supply voltage.

By dividing the intial capacitor charging time into 8 time windows, we can now compare the band module voltage charging time to find which window it falls into to determine the band module which created that voltage.

After doing all this, I found the firmware now uses 4002 words out of a possible 4096. Prety darn close to full!

Some other minor hardware changes -

QSK swich now controlled by the MUTE port only. This required adding an extra 2N7002 as an inverter. Series gate resistor and by pass cap added to isolate it from the mute port. Found out this is the primary path for excessive audio key clicks produced on the higher bands.

Made the board mounting holes larger so swag shoulder spacers can be used, like on the the QBSA board. This eliminates the nut and will make mounting the board into a case easier.

Connections to uP reset chip fixed.
Fixed trimmer cap spacing on band modules.

I'll probibly start collecting parts for this version soon. Hope to have most of the parts on hand by the time I leave for my spring hiking trip in mid April and be ready to start kitting when I get back, 4-6 weeks later.

Steve,

Why not go with the MSP430F2131 chip for the ATS-3B? Pin compatible with the 1121A, twice the flash code space, twice the speed, built-in pullup resistors, built-in brown-out.

Karl is correct.

More importantly the 3 filter board differ from the 3A
boards and presumably the 3B boards will differ from
the 3 and 3A boards. None will be easily
interchangable.

Hi Steve,

Are you considering any changes to the key click filter?
Perhaps make Q3 work as a constant current source.
Maybe a 4v zener across R14 if constant turn off times are an issue.

Steve.

Consider adding series resistors on the two keyer lines so the
MSP430's ESD protection diodes have a fighting chance.

Ever wrestle with a nylon sleeping bag in sub-freezing weather,
watching the sparks fly? Imagine touching the keyer on the wrong spot.

Or imagine a miss-wire in some RS232 level shifter that gets
jacked into the keyer connector.

Subject: [AT_Sprint] ATS-3B progress

I've decided to make only minimual changes to the -3A to migrate it to the -3B. The primary change will be to add 17 and 15 meters as standard. Limiting it to 15 meters will keep the rig current reasonable. The current starts to get pretty high if we push it to cover 10 meters.

Adding two bands and keeping the rig so it automatically detects each band module requires changing how the band modules are read by the processor. To do this, the processor reads a voltage from the band module, created by a voltage divider comprised of one of the 47K pull up resistors and a unique resistor value on each band module. Rather than using the more expensive processor with A2D converter, I implemented a simple slope A/D converter with the comparator in the F1121A.

It works by measuring the time it takes to charge a capacitor to 1/2 the processor supply voltage, as generated by the internal voltage reference. The capacitor is then discharged back to 0 volts and then measures the time it takes for the cap to charge up to the voltage generated by the band module resistor divider, which is always less than 1/2 the supply voltage.

By dividing the intial capacitor charging time into 8 time windows, we can now compare the band module voltage charging time to find which window it falls into to determine the band module which created that voltage.

After doing all this, I found the firmware now uses 4002 words out of a possible 4096. Prety darn close to full!

Some other minor hardware changes -

QSK swich now controlled by the MUTE port only. This required adding an extra 2N7002 as an inverter. Series gate resistor and by pass cap added to isolate it from the mute port. Found out this is the primary path for excessive audio key clicks produced on the higher bands.

Made the board mounting holes larger so swag shoulder spacers can be used, like on the the QBSA board. This eliminates the nut and will make mounting the board into a case easier.

Connections to uP reset chip fixed.
Fixed trimmer cap spacing on band modules.

I'll probibly start collecting parts for this version soon. Hope to have most of the parts on hand by the time I leave for my spring hiking trip in mid April and be ready to start kitting when I get back, 4-6 weeks later.

Hi Steve.

I am seriously working on the digital modes. Well, did not change a single line in the firmware yet, but I studied the MSP430 documentation and nearly finished the FET programmer.

> After doing all this, I found the firmware now uses 4002 words out of a
> possible 4096. Prety darn close to full!

May you please use a controller with more ROM? Otherwise I would have to comment out part of the original firmware to fit the new stuff. I think there are pin and program compatible and only slightly more expensive variants, like MSP430F1132, MSP430F1232 or even MSP430F2131 as KB2TQX suggested.

One thing to consider for digital modes. The crystal filter is too narrow for wide modes. It would be nice to have a panoramatic mode for PSK31 and it would even be easier to search for CW stations using a wider filter. Would it be possible to widen the filter by varicaps like in the Elecraft RIGs? I think two or three steps selectable from the menu shall be enough. I suppose generating the tuning voltage by 2 processor pins and three resistors may create a sufficient 4 bit D/A.

Thanks for your excellent work indeed!

Excellent news, Steve. What (or how many?) band modules will it
come with? Adding 17m and 15m to the original four gives six bands -
however the eight time windows seems to imply seven bands?
Personally, I have no interest in 160m and 80m - they require
excessively large antennas out of keeping with the small size of the
rig (ie rather like grafting an elephant trunk onto a mouse) and I
wonder how many others really want/use these bands.(poll or vote?)
If you were to have stayed with the 4 bnd format then my own
interest would have been for 40, 20, 17, 15m. Will you go with the
80mhz clock or something lower (to save on current drain). Is it
possible to increase the tuning speed on this version? The high
bands will be nice for DX'ing - 17m is open almost every day to
Europe and 15m will be soon....

Just do the math. 80 40 30 20 17 and 15 = 6 band modules.
> Adding 17m and 15m to the original four gives six bands -

I use 80 Meters often and my modest portable antenna works just
great on 80 meters. So I am NOT in favor of deleting 80 Meters.

1044. Re: [AT_Sprint] Re: ATS-3B progress

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-26 19:43:25 UTC
From: John A. Evans - N0HJ
Topic: 905 Message: 1044

That really doesn't answer the question, Karl, as the ATS-3B could have the capability of doing 160m as well. Whether Steve, KD1JV, decides to provide this option, is still up in the air. His post only mentioned adding 17m and 15m, so perhaps you are correct. However, Lutz Bergner has already modified an ATS-3 for 160m as well, so it is a possibility. I am sure that Steve will come out with specs when he is ready.

1045. ATS3B kit

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-26 19:54:22 UTC
From: Karl Larsen
Topic: 1045 Message: 1045

We have seen a lot of people who want to help Steven KD1JV design his new kit. But none of the help considers the lead time he has to have to put the kit together. I read and re-read his message on this list and yes it isn't exactly what I would have done, but Steven is DOING IT!

I have decided to buy the ATS3B and I am already getting the things ready to build the kit using the special solder laden flux and then when ALL the chips are in place apply heat and the board is done, almost.

Today I bought a cheap electric burner at Wal Mart and right now I'm adjusting the heat so the temperature is near 200 F. This is the proper pre-heat. Just checked it and the temperature is right on. I marked the setting.

The -3B will be six bands, the current 80-20 plus 17 and 15.

Enough people wanted 80 to make it worth making everyone pay for it. The ATS having 80M might be one reason so many contacts are made on that band in the winter during Spartin Sprints. OTOH, not too many people have an antenna for 160, so it makes no sense making everyone pay for a band few can use.

I divided the time count into 8 segements as its a lot easier to divide by 8 (rotate right three times) than it is to divide by 6.

I decided to limit the upper band to 15, so the DDS clock only had to go to 60 MHz. That will keep the supply current at a reasonable value. With a 80 MHz clock, the rig draws over 50 ma, which is getting a bit high. At 60 MHz, it should be in the 30's.

Bottom line is it's impossible to make one rig do all the things everyone wants. Especially a rig as small as the ATS. The ATS rigs are ment to be the smallest, lightest, most effiecent CW rigs around. It makes no sense to try and make it anything else. Have different objectives - get a different rig<G>

From: W2AGN
Topic: 1048 Message: 1048

Finished my "waterproof" MS15/MS30 rig. While not an AT Sprint, it was a predecessor by Steve, KD1JV. One complaint was that there was some drift, and the transmit offset was "iffy." SO, I used a DDS VFO (FCC1/FCC2). Stable, and I can use any transmit receive offset just by programming it. A side benefit is that the rig will work RTTY! I also added an NEScaf audio filter and Picokeyer to the box.

I am sorry to say I did not build the MS15 or MS30 boards. I did build the rest of it. Works great, with about 3.5 watts out on 15, and 5+ (actually 7, if turned up) on 30M. I cranked it back to 2W and tried RTTY, and that seems to work, also, although didn't make a contact. (Not many RTTY on at the time). Decoded well from a secondary receiver, though.

Karl,
It's good to hear that you use 80 meters with a 'modest portable antenna' and get good results. Perhaps you could explain or describe this antenna, because I would love to try it. My operating situation currently is a third floor apartment, FT-817, and homebrew shorty antenna (22 ft long, with tapped PVC loading coils for 40, 30, 20, 17, 15m)mounted on the balcony. It gets out nicely with almost daily contacts to Europe on 20 and 17 and occasionally on 30 and 40m. I have tried loading it (by tying inner and outer conductors of coax) and also a 28 ft wire with my tuner (against power outlet ground) on 80m and even stations across town can't hear me. If I had an antenna that worked on 80 I too would try it.

I don't know about Karl, but I have used 2 different Portable antennas on 80M. For a long contest, like Field Day, I use a 100' CF Zepp. I usually support the center with a 30' DK9SQ pole, and the ends as High as I can reach in nearby trees or bushes. I have worked across country with this on FD and 5W from a K2.

My "Quickie" portable antenna is a 66' wire, shot up over a tree with an "antenna launcher" (called a slingshot in some states). I use a 33' counterpoise laid on the ground if I can. If not, and I am near the car, I use the car body as a counterpoise. Works terrific 40M and up, and I have made contacts as far as GA with it on 80M.

Hi All, Here is what 80 Meters needs for serious DX chasing and just great signals every day of the year and without any Solar Effects problems. This antenna is what you want:

Length: 136 feet center fed.
Feedline: 450 ohm windowed twinlead.
Height: At least 70 feet above Ground (better than 1/2 Wavelength)

About 1956 there was an old Ham in Roswell, NM and he had a 80 meter antenna like the above. We were on AM Phone and when he came on the air with his DX100 at 100 Watts he sounded like the Voice of America. Never lower than 40 DB over S9. His antenna was between two 80 foot telephone poles.

As a general rule we don't have the space for this antenna nor the poles :-)

Today my 80 meter antenna at home is a dipole 100 feet long fed in the center with 450 ohm balanced cable. It is about 40 feet high at the center and then slopes down sharp to about 10 feet at the ends. This is not good, but it works ok.

My portable antenna is 85 feet long and I put it up as an inverted L. I have two counterpoise 30 and 35 feet long. Get the antenna as high as possible. A good friend uses the inverted L and his wire is longer but still not a half wave on 80 meters. He is beating me in the Fox Hunts on 80 meters.

From: Hank Greeb
Topic: 905 Message: 1052

Best antenna array I ever fielded for Field day was an inverted "V" dipole @ 50 feet in the center with the ends at about 15 feet for 80 metres, favoring north and south, and a W8JK wire beam cut for 40 and 20 metres at the same height favoring east and west. Both were fed with 450 ohm "windowed" twin lead. With a HW-9 I placed #2 or #3 three years running in Class 1B-1OP Battery (QRP) using these antennae. I don't exactly remember the gain of the 8JK beam, but vague recollection is something like 8 dBd, bi directional, favoring the east and west coast. The mast was home brew from lengths of irrigation tubing, 4", 3", and 2", rigged so I could put the array up single handedly. Note that the directions were chosen for SW Ohio, the choice of directions may vary with your location.

At times I could "hold and run" a frequency on 40 or 20 metres, even though the HW-9 was putting out only 4 watts to the power meter. I used a Johnson Matchbox for coupling between the rig and the antennae.

Of course, these daze my puny effort of 350 to 400 contacts in 24 hours would be considered mediocre, but it was fun. Folks have figured out how to get 500 or more contacts in 24 hours even with QRP....

For truly portable operation, I always carried 30' of TV mast with our camping gear, and ran a 80 metre dipole, rigged as two of three guys, fed with the same 450 ohm feedline, and used the same transmatch. I generally packed a 100 watt rig, most recently a Drake TR-7, but sometimes the HW-9. This setup allowed me to handle several TCC traffic from the east to the west part of the United States, generally on 20 metres.

The very "best" portable operation I had was during a 1970's Ohio QSO party, where we rented a cabin in a state park on top of some very small "mountains" in eastern Ohio, and there were ubiquitous 70' naturally growing antennae masts. The spacing was such that I could only put up a 40 metre halfwave, which I fed with 450 Ohm line. At 70' it did a credible job - folks on the Ohio SSB net were giving me signal reports better than I received from am 80 metre extended double zepp at 50' which I used at home.

Methinks investment in antennae is the first and best utilization of resources for a ham radio station. Second is receiver. A far third is transmitter power.

1053. ATS3/ATS3A Keying Envelope Fix

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-02-28 08:44:56 UTC
From: jgaffke
Topic: 1053 Message: 1053

I may have a solution to the keying envelope issues that Carey Fuller, KX0R, describes in his document over in the files section.

A simple fix for the abrupt falling edges when operating above 10 volts is to put a 4.3v zener across R14. I didn't try this part of the fix by itself. This should solve most of the problem.

Here's a more complete fix that also stabilizes the rising edge of the envelope over supply voltage:

Replace the 2N7002 at Q3 with an MMBT3904.
Remove R13, replacing it with 0 ohms.
Insert a 10K resistor between the MMBT3904's emitter and ground.
Replace R14 with 100K, and put the 4.3 volt zener diode across it.
Add two 10K resistors in series from signal T/R to ground, and drive Q3's base from the midpoint.

That's it. Gave me consistent results with ~2ms rise and fall times across a supply range of five to twelve volts. You could probably skip those 10K's in the base node if never operating below about 6.5 volts (you will have to adjust the emitter resistor to 22K or so).

These mods are easier on the ATS3 than on the ATS3A, as the MMBT3904 and one of the 10K resistors at its base are already done for you. The MMBT3904 footprint maps nicely to that of the 2N7002, same SOT-23 orientation.

A good choice for the zener might be Digikey's MAZ80430MLCT-ND, 4.30 volts. It's in a package the same size as the 0805 at R14, so can stack right on top of it. For prototyping I used two small LEDs instead, each had a forward drop of 2.0 volts.

I put two 10K resistors standing up on end at the base and emitter pads of Q3, then installed the MMBT3904 on top of that, only the collector tab touches the board. (If you feel confident, you could cut traces instead.) Then solder another 10K to the ground node on the nearby caps, and run a wire from it to the MMBT3904 base.

Before the hack, I measured rise and fall times at 6 and 12 volts. Everything was well behaved at 6 volts, as Carey reports. But as the supply voltage rises, the gate of Q4 goes more quickly through the transition region (which is just below Vcc) on the rising edge of the signal, as that is the steep part of the exponential curve and it has much further to go. But the new resistor in the emitter leg makes Q3 a constant current source when on, regardless of the supply voltage. So the voltage at the gate of Q4 now falls in a linear fashion as it travels through the transition region in response to key down.

With higher supply voltages, the quesient 'on' voltage at the gate of Q4 becomes further removed from Vcc, and so has further to travel to turn Q4 back off. This delay in turning off Q4 becomes extreme at 12 volts, where Q4 hasn't even started to turn off when the DDS shuts down the square wave into U8. So at 12 volts, the falling edge of the envelope is pretty much instantaneous. The zener removes this delay by preventing Q4's gate from ever going beyond 4.3 volts below Vcc.

The values listed are just the first I tried, may be better choices. The zener voltage must be high enough to ensure Q4 turns fully on, but not so high that the delay starts to reappear. First trim R14 for the falling edge, then choose the emitter resistor at Q3 for the best rising edge of the envelope.

With the 10K dividers on Q3's base, the 'on' voltage there is 1.75v, so we see about 1.15 volts at the emitter. The current source operates at 1.15v/10K = 0.115 ma. With just over a volt at the collector of Q3, we have enough headroom to turn Q4 on at supply voltages down to 5 volts.

Just got this working an hour or so ago. Probably have more adjustments to make once this gets reviewed.

Topic: 1054 Message: 1055

The ZM-2 is a great tuner - I've used it quite a bit for doublets fed with twinlead and it is a solid performer. I did give it up, however, for backpacking purposes as an L tuner for end fed wires is a lot lighter (that darned toroid in the ZM-2 weighs a lot) and takes up less space in my backpack. For casual backpacking or field use, the ZM-2 is very hard to beat though.

From: radio_kx0r
Topic: 1053 Message: 1056

Jerry,

I just re-read your clear explanation of your keying mod while looking at my schematic. The concept of the current source was what I missed when I tried to improve the keying. While my simple mod of changing R13 from 22K to 56K works OK for a 9-12V supply, it ruins the lower voltage range 6-9V. It sounds like you've found a much better answer.

Please post an update here once you've played with the values a bit more. It might save the rest of us some frustration and possibly even damage to our rigs. If you feel like you've got the values right, we'll follow.

Your explanation of how the original circuit works and why it fails at high V+ is excellent. I saw the same thing on my scope - at high supply C42 and C43 stay charged so long that the DDS drive signal is cut off before the keying circuit can decay and shape the signal. The resulting sharp "break" waveform is horrible and not what we want to sound like.

This is exactly what I hoped would happen when I posted the original observations - someone smarter would think about the problem and come up with a better answer. If this works out, perhaps Steve would consider including the mod in the new "B" - this seems to be almost cost neutral.

You've also confirmed that probably most of the unmodified ATS-3 and 3A rigs DO have this keying problem at higher supply voltages - it's not just some variation in parts or whatever.

Please confirm that Q4 is drawn incorrectly (source and drain reversed) on our schematics - this could prove confusing to others as they work through this mod.

Thanks for taking the time to solve this little puzzle. It would be nice if you could post a modified circuit - perhaps just a pdf or jpg of a sketch in the "FILES" area here - to help others. I followed your clear explanation just fine, but I spent some time studying this little circuit when I noticed the problem. If you post a drawing, it may well be the universal shaped-keying circuit for lots of similar rigs...might as well make it easy to copy.

This is a modulator, not a switch...

From: jgaffke
Topic: 1053 Message: 1057

Hi Carey,

Thanks for the comments. I'll try to get a schematic and additional notes up in the files section this weekend.

Most people will probably want to stick with just the zener fix. It is simple to do and takes care of that abrupt falling edge. The relatively difficult hacks for turning Q3 into a constant current source give less in return.

I'm a bit worried about 100 orders getting fired off to Digikey for that zener, only to find it's not quite the right part.
On page 3 of the NDT2955 datasheet
http://www.fairchildsemi.com/ds/ND/NDT2955.pdf
figure 4 shows that -4 volts of Vgs is "typically" towards the wrong side of the knee. The nominally 4.3v zener can range from 4.0 to 4.6. So at 4.7 volts, the MAZ80470MLCT-ND might be a better choice, will try to make a solid recommendation when I put up the schematics after double checking the resultant delays we get. At six volts, the stock ATS3A will have a Vgs of around -4.1 volts,
this rises proportionally to the supply voltage.

Those with stocks of surface mount parts, xacto knives, a binocular microscope, oscilloscope, multiple soldering irons, no coffee, and a really anal disposition might consider the rest of the mods. If you have no way of inspecting the resulting envelope, perhaps best left undone. I was reasonably happy with what I got, but thats a matter of taste. In particular, not clear at what point a linear ramp on the rising edge "matches" an exponential falling edge. Edges are still a bit fast, could slow them by adding capacitance or scaling both resistors.

In my previous posting:
>>You could probably skip those 10K's in the base node if never
>>operating below about 6.5 volts (you will have to adjust the
>>emitter resistor to 22K or so).

Make that at least 7 volts. 6.5 volts only gives a Vgs of about -3.5, and Q4 will not be fully on. Vgs ~= Vcc = (Vb - 0.6 + 0.1), where Q3's Vb is now 3.5 volts directly from the MSP430's upper rail.

And from last week, when I wrote:
>Re: ATS-3B progress
>Consider adding series resistors on the two keyer lines so the
>MSP430's ESD protection diodes have a fighting chance.

No reason to panic here. Those .01uF caps might help a bit on static discharge from a finger, and a series 100 to 1K resistor might not.

Body capacitance is quite low, and skin resistance high. But if I were to start jacking other equipment into the keyer port beyond a paddle, I would consider series resistors as a measure of extra protection.

I've been getting emails about the AT_3 qrp rig. Where can I get more info? I would like to build one . Thanks for your help. Jerry WB1A

"John A. Evans - N0HJ" <jaevans@...> wrote: The ZM-2 is a great tuner - I've used it quite a bit for doublets fed with twinlead and it is a solid performer. I did give it up, however, for backpacking purposes as an L tuner for end fed wires is a lot lighter (that darned toroid in the ZM-2 weighs a lot) and takes up less space in my backpack. For casual backpacking or field use, the ZM-2 is very hard to beat though.

Hi Jerry,

None in production at this time. Keep your eyes and
ears open for used ones that pop up from time to time.
Also, sometime after April Steve/kd1jv will be kitting
a 6 band version (the ATS-3B). Watch his website and
listen on this group for the announcement.

While you are waiting feel free to read the archives
of this group. Lot's of good information tucked away
there. Be sure to check out photos of rigs that users
have built. Lot's of fine builders and operators are
on this list.

In addition to a 4.7v zener across R14, perhaps increase R13 to
something like Carey's 56K. Both very easy mods to current rigs.

The zener stablizes fall times across variations in supply
voltage, the envelope fall time is determined by R14.
Envelope rise times will be much longer due to the change at R13,
shoot for 6 or 7 ms at 6v so it is still reasonably slow at 12v.
Will try it this weekend.

As far as new designs, either way is fine by me. The 'current source'
approach is nice, but that's two more 0805's to have cold solder
joints on. Perhaps at least route the board such that the trace
to Q3's gate can be cut.

1063. Lutz's Murata Filter Mod

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-03-02 00:52:00 UTC
From: JT Croteau
Topic: 1063 Message: 1063

Has anyone actually performed Lutz's Front End Filter Mod using the Murata 7.02 filter? I've seen a couple posts from Lutz where he recommends against doing it. I took part on the group buy of these filters and have three of them in my box, wondering what I should be doing with them now.

The only mod presently applied to my ATS-3 is the NR4E filter mod.

I've used my ATS3 on my 88ft dipole here in MD where I am pounded by SWBC originating in NC and TN. The QSK diodes go into conduction and I get interference in the 40M band as a result. I think the better course of action is doing the QSK mod which substitutes switches for the QSK diodes.

I'm going to build up the ATS3B this summer and probably let my ATS3 go for sale otherwise I would be doing the QSK mod.

Hi all,

Just uploaded 2 PDF files to the files section with plots of my 40m LC filter response and the response of the murata ceramic filter. Please subtract 21db from insertion loss. I used a L shaped resistive matching network for the 1.5kOhm side of the RX filter (pin 1).
When you look at these files , you will easely see why I am discouraging the ceramic filter.
Just finished my AD9951 based scalar network analyzer and hence was able to supply these plots.

Jerry,

If I understand your question, you are in the right place to learn more about the AT Sprint radio. You might want to look at some of the Photos and read some of the Files on the Yahoo Page to get a feel for the rig.

Steve does not have any kits available right now, but we are hearing he is working on the next version, the ATS-3B. Stay tuned here on this reflector to find out more.

I just finished the ATS3A main board. It fired up first time and all checked out OK. Love that feeling!

I built the 20 meter filter board and it too worked but not as I expected. I am only seeing about 2.5 watts at 12 volts.
The caps are correct and I have the correct turn count on the coils. Spreading the turns doesn't change anything much.

Any suggestions?

Pete,
Just a shot in the dark here, you did use the yellow toroids right? Check the output of the PA with an RF probe on pin 5 of the filter board and see if you have full power there (or jumper pin 5 to the antenna terminal and check with a watt meter). That will tell you if it is a filter problem or something in the RF chain.

Guys,

While my project doesn't have the technical elegance of some of the work that gets posted here, it is something I have done. I found a good use for the Altoids Smalls tin, it holds the L4940-12 nicely and acts as a heat sink for the regulator. I use Anderson Powerpoles for all my 12VDC distribution so I used a pig tail for the input with Powerpoles connectors and a pigtail with the coaxial power connector for the ATS-3 on the other end. I used epoxy to hold the conductors in place in the tin, a jpg is in the photos under W7RDP.

Datasheet says the L4940-12 can survive a reverse Vin of up to -15
volts: www.st.com/stonline/products/literature/ds/2141.pdf
The SS12 Schottky at D1 can survive -20 volts.
http://www.fairchildsemi.com/ds/SS/SS12.pdf

Typical dropout voltage at 0.5 A is 200mv on the L4940-12.
The SS12 is more like 400mv.

Height above board is 4.6mm max in both the D2PAK and TO220 packages,
same as the height of the aluminum standoffs between the ATS3A
and the front panel. Top of part is plastic, won't short.

So might solder the tab and center pin of the L4940-12 to the
back of the ATS3A PC board in that large region of copper near
the crystal filter, replacing the SS12 Schottky reverse protection
diode. Lift up the Vin and Vout pins, add the 0.1uF and 22uF
bypass caps from the datasheet between the pin and the groundplane,
add wires to where D1 was. The copper serves as a heat sink.
These linear regulators can be unstable if the caps are left off.

I suppose that extra heat could cause trouble.
But the L4940-12 shouldn't get very warm unless you are
feeding the rig more than 12v.

I've learned a few things regarding that key click filter.
My initial screed still stands, with a few minor adjustments.

>Most people will probably want to stick with just the zener fix.

Still true. Try a 5.1 or 5.6v zener spec'ed for 5ma (the 50ma guys leak way too much) across R14. If the key down voltage between Q4's gate and V+ is between 4.5 and 5.5 volts, that will avoid the DDS turnoff issue that we see with V+ above 10v. At 100 uA, the voltage is well below the zener's nominal voltage.

C42 and C43 should go from V+ to Q4's gate, not from Gnd, since Vgs at Q4 is measured from V+ to the gate. When tied to Gnd, the envelope transitions are mangled by any fluctuations in V+, resulting in slower envelope rising edges and faster envelope falling edges.

When making Q3 a current source, it's easy enough to get something to work, not clear what will work across all part variations. It's a balancing act between reasonably slow envelope transitions on the one hand and pretty much everything else on the other.

Transition region for my NDT2955 occurs with a Vgs of between -3 and -3.5 volts. Given how far Vgs swings with key up and key down, envelope rise and fall times have to be kept fairly sharp or delays get out of hand. The DDS chip shuts down U8 about 7.75ms after key up.

Drop across an LED is typically more like 1.7 volts than the 2.0 volts reported earlier, when operating at ~100 uA. I'm now using three LED's (was 2) to avoid Q4's transition region. Diodes that zener at voltages below 5 volts have curves like a resistor.

Best results so far are with a 68K resistor at R14, 0 ohms at R13, an MMBT3904 at Q3 with a 12K emitter resistor to Gnd, two 0.1uF caps from Q4's gate to V+, and two 10K resistors in series from signal T/R to Gnd with center point driving the base of Q3. I'm using LED's across R14, datasheet curves favor the 5.1 or 5.6v MAZ80510MLCT-ND. I see envelope rise/fall times of ~1.75 ms across V+ = 5 to 12v.

May be best to scale up the current and uF's at C42,C43 by 5x. We're only talking one mA or so, and only with key down.

It may be possible to use the 2N7002 of the ATS3a as a current source with no resistor divider on the gate, if the source resistor to ground is checked (and possibly trimmed) for correct key down voltage (and thus current). Makes the ATS3a an easy mod.

I saw a Vgs of around 1.6v when operating the 2n7002 at ~200 uA.

Still poking at this occasionally when I have time.
Will post to the files section when I have more complete results.

I implemented very nice envelope control in another homebrew transmitter with a similar FET switch simply by connecting a capacitor between drain and gate of the power FET, and adjusting the drive resistors to get the desired rise-fall time. The capacitive feedback, working against the drive resistor, turns the switch into a very nice integrator with very linear & symmetrical rise and fall ramps.

1079. Olimex MSP430-JTAG - bad design

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-03-08 19:22:49 UTC
From: Vojtěch Bubník
Topic: 1079 Message: 1079

Hi gang.

I built a copy of the Olimex MSP430-JTAG programming interface to program my ATS-3A.
http://www.olimex.com/dev/pdf/msp430-jtag-d.pdf

I am not a hardware guy, so I rather checked everything ten times before frying the MSP430 controller in the transceiver. I was surprised that in some cases the output on some pins was as high as 3.8V although everything is supposed to be sourced from a 3.3V stabilizer. The 3.8V are just on the boundary of the absolute maximum ratings of the MSP430 microcontroller, which is Vcc + 0.3V. The absolute maximum ratings would be exceeded if programming ATS-3, which controller is powered by 3.3V.

The problem is that the pullup resistors R16 and R17 are pulling up not just the two particular parallel port pins, but also Vdd. I am not sure whether the two pullups are needed. It seems that some parallel ports in some mode need them, but my does not. The fix is either to connect the R16 and R17 to input of the stabilizer instead of Vdd, or to let them disconnected.

Safe programming and VY 73,
Vojtech OK1IAK

Hi Joe,

That's a great idea!
Your approach allows us to slew the gate at Q4 quickly
to avoid those delays, the feedback cap slows things down
only when going through Q4's transition region.

Jerry,

I put a photo of the waveshaped RF envelope in the Files section in the W3JDR folder, in a sub-folder named Photos. If you want the schematic & component values, I'll post them too.

I can't imagine that R16 and R17 (33K each) combined are sourcing anywhere close to the maximum current that U1 is able to sink. If U1 is working properly it should easily be able to maintain VDD equal to the reference voltage on PIN4.

Forget all that talk of zeners and current sources.
Joe Rocci's fix works, is easy to do, and the results look great.
It looks like it is also less sensitive to device characteristics.
Same mods should work fine on the ATS3.

I restored my ATS3a back to its original state, then:
Removed the two 0.1uF caps at C42, C43 (C53, C54 on ATS3)
Added two 0.01uF caps from drain to gate at Q4 (Q5 on ATS3)
Added a 100k resistor across C45 (C56 on ATS3)

The new parts can be 0805's.
Removing the old caps is easily done using two soldering irons.
I added the 0.01uF caps right on top of Q4's leads, the drain is the
middle pin and the gate is that top outside pin connected to R13.
The 100K resistor across C45 is non-critical, could be 10K to 1Meg,
and is there to keep Q4 leakage from charging up C45 when Q4 is off.

The result with 12 volts is a beautiful trapezoidal RF envelope
with a 0.9 ms rise time and 4.0 ms fall time. At 6 volts, we get a
slightly rounded 4.0 ms rise time and a straight 2.0 ms fall time.
This is much better than it was, at 12 volts we used to have
a 0.5 ms rise time and a very abrupt fall.

Let us know if anyone sees a way to improve on this, especially
that 0.9 ms rise time at 12 volts. Keep in mind that with key up
and a 6 volt supply, Q4's Vgs must be at least -4 volts. After a
week or so, perhaps Carey could prepend this posting plus any
amendments to his keying document in the group's files section.

Jerry,

If you massage the resistor ratios (drive resistor vs pullup resistor), you should be able to get rise & fall times that are approximately equal as in my photo.

BTW, I also posted a partial schematic of my own homebrew Class E transmitter in the Photos section of my W3JDR folder. It runs about 90% efficient on 40M. Note particularly that the RF amp is AC coupled with some DC bias on the gates of the FETS. This came about as a result of Spice simulations, and it improves the stage efficiency and overall operation when you have low (under 5Vpp) gate drive. Actually, my whole transmitter was analyzed and optimized in Spice before building it, and the results were very close to the simulation.

I encourage all to use Spice before heating up the soldering irons and wrecking PCB's by soldering and unsoldering these hard-to-work-with parts. If you can get a ham license and learn to work with SMD parts, you can learn Spice. Also, it will vastly improve your understanding of how circuits work. There are many free versions available for download. Many people like LTSpice from Linear Technology (www.linear.com), but I find its user interface to be cumbersome. Check out SiMetrix from Catena (www.catena.uk.com) for a free, very nice and easy to use Spice that has a large built-in library of part types.

Jerry and Joe,

You both have done much great work on the keying problem. I was almost ready to start cutting on my ATS3A when I read these recent messages. In spite of understanding the problem, what we need now is a circuit, drawn in the same arrangement as the original, with designators and component values, so that a non-engineer can make the mods needed to restore good keying to the ATS3 or ATS3A, without having to hunt through all these emails.

Even though I understand what both of you have written about your mods, I would have trouble duplicating your work at this point.

We need to lay this out in cookbook fashion for everyone who wants to do the mod, and maybe even for Steve to see, unless he's already ahead of us on this.

I think .9 ms rise is too short - we need to be at about 2-5 ms for the right sound and no clicks, in my opinion. I don't think we have this quite worked out where poeple can duplicate it. My original change of one resistor actually gives a pretty good result at 10-12V, so I'm still reluctant to start cutting or melting until we have something better over the whole voltage range. Maybe we'll end up with something like Joe's circuit, but add a jumper to tweak it for higher or lower voltages. Joe's waveforms are sweet, but that's not the ATS3A rig, right? That circuit posted just looks too simple, and I can't quite relate it to the ATS3A yet.

I think we're nearly there...

Thank you - when I first posted my notes on the keying, I thought maybe I was all wrong and had done something goofy - then there was little respone for a while. This may yet have a nice ending.

Hi Joe,

I'm not so sure we can do much better without somewhat
more extensive mods.

In the schematic in your file "keying_ckt.jpg", with Q4 off we have
R1 driving the gate from 8_VDC (I assume 8 volts) through 10K.
With Q4 on, we drive the gate with the thevenin equivalent of
R1 and R2 in parallel, or 3.55 volts through 4.44K.

You get symetric waveforms if the currents from the two above
cases into C2 are equal as the gate of Q1 goes through its
transition region. From this, I figure Q1's transition region
to be centered on 4.9 volts, which agrees with figure 3 of
www.irf.com/product-info/datasheets/data/irfl9014.pdf

On the ATS3A, we must operate from 6 to 12 volts. At 6 volts with
key down, Q4's Vgs must be at least -4 volts, so R13 must be no more
than half the ohms of R14. The envelope rounds out with key down
at 6 volts since our thevenin equivalent drive voltage of 4 volts
is very close to where Q4's gate wants to be during the transition,
and thus the current into the feedback cap is low.

We could do better by replacing Q3 with an LMC7211 comparator in
the SOT23-5 package: http://cache.national.com/ds/LM/LMC7211.pdf
Pins 4 and 5 drop right into Q3's T/R and Gnd pads, pins 1,2,3
are wired up to the bottom of R14 (R13 is removed), source pin of Q4
(for V+), and perhaps the top of C24 for a 2.5v reference voltage,
respectively. With key down, this drives R14 with V+ volts. With key
up, drives R14 with Gnd. Should work fine with V+ from 5 to 12v.
Still not symmetric at 12v, but much better than the simple mod.

Could go even further and power the LMC7211 between V+ and a rail
at (V+ - 2*Vgs), the rail set by a zener. I figure Vgs to be
around 3.25v at the center of Q4's transition. Add 2 resistors to
set a reference for input+, add three more in series to allow the
MSP430 to lightly drive input- around that reference.
This would give symmetric and consistent slew rates across
supply voltage. Note that actual rise and fall times increase
with the envelope amplitude, not sure how one would best fix this.

I'll try to post schematics over the weekend for all of the above,
that's all the time I have for this today.

The schematic I posted isn't quite what I ended up with. My actual keying circuit is almost identical to the ATS-3A circuit except I used a different but similar switching FET (IRFL9014), so it's pretty easy to make the mods. Keep in mind I haven't tested his on the ATS-3A yet, just in my rig, but it should work. Perhaps Jerry or someone else who has time to test it can verify the result:

Change R14 from 47K to 100K
Change R13 from 22K to 10 K
Remove C42
Remove C43
Solder a .01uf from the gate of Q4 to the drain of Q4 (the drain is the side that C45 is connected to).

Perhaps after this is tested and verified, someone can post a photo of the mods.

Subject: [AT_Sprint] Re: ATS3/ATS3A Keying Envelope Fix

Jerry and Joe,

You both have done much great work on the keying problem. I was almost ready to start cutting on my ATS3A when I read these recent messages. In spite of understanding the problem, what we need now is a circuit, drawn in the same arrangement as the original, with designators and component values, so that a non-engineer can make the mods needed to restore good keying to the ATS3 or ATS3A, without having to hunt through all these emails.

Even though I understand what both of you have written about your mods, I would have trouble duplicating your work at this point.

We need to lay this out in cookbook fashion for everyone who wants to do the mod, and maybe even for Steve to see, unless he's already ahead of us on this.

I think .9 ms rise is too short - we need to be at about 2-5 ms for the right sound and no clicks, in my opinion. I don't think we have this quite worked out where poeple can duplicate it. My original change of one resistor actually gives a pretty good result at 10-12V, so I'm still reluctant to start cutting or melting until we have something better over the whole voltage range. Maybe we'll end up

with something like Joe's circuit, but add a jumper to tweak it for
higher or lower voltages. Joe's waveforms are sweet, but that's not
the ATS3A rig, right? That circuit posted just looks too simple, and
I can't quite relate it to the ATS3A yet.

I think we're nearly there...

Thank you - when I first posted my notes on the keying, I thought
maybe I was all wrong and had done something goofy - then there was
little respone for a while. This may yet have a nice ending.

Joe,

Did the circuit you posted in keying_ckt.jpg give a waveform
like that posted in waveshaping.jpg using R1=100K, R2=10K,
C2=0.01uF, 8_VDC=8 volts? If not, how did you arrive at 10K/100K?

I may be missing something here (I often am), but those values
look like they would give some rather asymmetrical results.

Some minor corrections are needed here:

>I figure Q1's transition region to be centered on 4.9 volts,
Thats a Vgs of -4.9 volts, so 4.9 volts below the 8 volt rail.

>We could do better by replacing Q3 with an LMC7211 comparator...
>With key down, this drives R14 with V+ volts.
>With key up, drives R14 with Gnd.
I got key down and key up reversed here. Note that the MSP430
is driving the INPUT- pin of the LMC7211 comparator,
so the comparator inverts just like the transistor did.

Jerry,

See my last post.

After I read my notes I realized that the schematic I posted was out of date. The real circuit is exactly like the ATS, except for the feedback cap. With the values I posted in the last email, the charge and discharge currents are only 10% different. It works (at least at 9 volts) as can be seen from the envelope I posted.

Hi Joe,

I'm not so sure we can do much better without somewhat
more extensive mods.

In the schematic in your file "keying_ckt.jpg", with Q4 off we have
R1 driving the gate from 8_VDC (I assume 8 volts) through 10K.
With Q4 on, we drive the gate with the thevenin equivalent of
R1 and R2 in parallel, or 3.55 volts through 4.44K.

You get symetric waveforms if the currents from the two above
cases into C2 are equal as the gate of Q1 goes through its
transition region. From this, I figure Q1's transition region
to be centered on 4.9 volts, which agrees with figure 3 of
www.irf.com/product-info/datasheets/data/irfl9014.pdf

On the ATS3A, we must operate from 6 to 12 volts. At 6 volts with
key down, Q4's Vgs must be at least -4 volts, so R13 must be no more
than half the ohms of R14. The envelope rounds out with key down
at 6 volts since our thevenin equivalent drive voltage of 4 volts
is very close to where Q4's gate wants to be during the transition,
and thus the current into the feedback cap is low.

We could do better by replacing Q3 with an LMC7211 comparator in
the SOT23-5 package: http://cache.national.com/ds/LM/LMC7211.pdf
Pins 4 and 5 drop right into Q3's T/R and Gnd pads, pins 1,2,3
are wired up to the bottom of R14 (R13 is removed), source pin of Q4
(for V+), and perhaps the top of C24 for a 2.5v reference voltage,
respectively. With key down, this drives R14 with V+ volts. With key

up, drives R14 with Gnd. Should work fine with V+ from 5 to 12v.
Still not symmetric at 12v, but much better than the simple mod.

Could go even further and power the LMC7211 between V+ and a rail
at (V+ - 2*Vgs), the rail set by a zener. I figure Vgs to be
around 3.25v at the center of Q4's transition. Add 2 resistors to
set a reference for input+, add three more in series to allow the
MSP430 to lightly drive input- around that reference.
This would give symmetric and consistent slew rates across
supply voltage. Note that actual rise and fall times increase
with the envelope amplitude, not sure how one would best fix this.

I'll try to post schematics over the weekend for all of the above,
that's all the time I have for this today.

I just checked my actual unit and my notes again, and what said in my last post is still accurate - my switching circuit is the same basic topology as the AST3A except for the changes I noted. I also ran the Spice simulation again. At 9V (my circuit runs on 9V, not 6V) the rise & fall times are about 2ms with the values noted (.01uf driving against 100K; 10K pullup). At 6V, the feedback cap needs to be reduced by a factor of about 2 to get the same result. A 'straddle' value can probably be determined that will work sufficiently well for both voltages.

OK guys, one more time.....

It's Friday afternoon and I'm running around trying to finish a lot of things and I'm moving too fast and I'm tired, and I still don't have this straight for you. Anyway, here's what I think is finally an accurate description of how the circuit should be. I just posted 2 screen captures in a new folder (inside W3JDR/Photos). One of them shows the circuit in the Spice schematic capture window and the other shows the simulation result. As you can see, the correct circuit IS a little different than the present ATS-3A circuit, but not hard to implement. I know this circuit works as described previously because I've built about 6 transmitters using it and they all work as the photo of the RF envelope shows. The only variable I see in reproduceability would be the FET used in the ATS vs the FET I used. I doubt if there will be much difference.

Sorry for the confusion.....back to my chaotic day

Hi Joe,

That explains it, your spice model circuit looks great!
I'd expect pretty much the same performance as that comparator
scheme I was proposing earlier this morning, but with much
less trouble. I think we can trim it to keep all rise/fall times
within the 3 to 6 ms region across the 6 to 12 volt supply range.
In fact, should work fine to below 5 volts.

Thanks!

Okay, I've been trying the various ideas presented. Joe's 100K pull up and .01 from gate to drain results in reasonably consistand fall times, 2 ms at 6 v and 4 ms at 12 volts. Having the slower fall time at higher power is good.

The real problem is getting consistant rise times. I finally found a solution to that. The trick is to work against a voltage which is constant in respect to the supply voltage. I connected a 5.1 volt zener from the + supply to ground through a 2.2 K resistor. This produces a voltage which is always 5 volts less than the supply. In order to switch the discharge resistor in and out, a 2N3904 is added. The base connects to the zener/resistor, the collector to the discharge resistor and the emittor back to the 2N7002 drain. 47 K for the discharge resistor gives a pretty consistant 4 ms rise time over the 2:1 supply voltage range.

This is not a real clean mod to make, but seems to work the best if you want it to do so over a wide supply range. Hopefully I can fit these parts on the "B" board <G>

Steve,

Your mod sounds good for the next rev PCB, but I don't think there will be too much of a problem if the simpler mod I suggested is implemented and optimized at 12V. When you drop to 6V the rise time will double but the fall time is pretty constant. The 2:1 increase in rise time at 6V shouldn'y be a problem so long as it wasn't any longer than necessary at 12V. It will make the keying a little 'softer' at low power levels, but my gut feeling is that it will be tolerable.

I'm not modeling this, just sitting at my desk thinking
on a Friday afternoon when I should be working.
Not sure what would really work.

Maybe take Joe's spice circuit and put the zener in parallel
with his 10K, then add a 1K in series with the 2n7002 drain lead
to limit the zener current. The zener current only flows when
the key is down. When V+ is down at 5 volts, we still have
a quiesent Vgs at Q4 of -4.5 volts with key down.
This should be an easy mod, and give constant slew rates
across varying supply voltages.

The zener voltage should be high enough to put the NDT2955 Vgs
transition region in the middle of the gate swing to keep things symetrical.
I think that's about 6.5 volts, since I was seeing Q4 transitions
at Vgs between 3 and 3.5 volts. I'd err on the side of too big.

Please disregard the keying fix I posted earlier. There needs to be at least one more resistor inserted, between the emitter of the transistor and drain of the 7002. Can't have a zener connected to the + supply, going through a diode junction in the transistor and then try to pull it to ground! Seems it burns out the 7002.

What I think will work, and eliminates the transisor is to connect R13 to the zener/2.2K junction and turning that on and off the ground end of the 2.2 K directly with the 2N7002.

Unfortunetly, it seems I've got a serious static problem today and have distoyed every mosfet I've touched the last few hours, including the pass fet and pull up output of the MSP430! I give up. Three days of subzero temps with dew points of -30 degress has caught up with me, dispite the wooden work bench and bare concrete floor. Never had static problems here before.

In the files section under KE7ER is the schematic keyclick00.pdf
Though not final, I think it shows where we are headed on this.
I don't have a soldering iron with me this evening, but did have
a schematic editor.

It's mostly Joe's circuit, using capacitive feedback around Q4.
It also has a zener to keep things more or less symmetrical at 12v.
Values shown are a bit conservative, we probably want softer
rise and fall times. The zener should be one of the smaller
guys, with the voltage shown spec'ed at 5 ma.

When modding an old rig, the zener is not really necessary.
If the zener is left out, then R13 can be zero ohms (a wire).
That makes it easier to use the available pads and traces.
When modding an ATS3 you can leave Q3 as it is, the mods
start with R13 (R14 on the ATS3).

Of course you may not want to hack your rig just yet if you
don't have a scope, nobody has actually proved this out yet.

I also posted the ATS3A manual, so those with an ATS3 can
better follow the reference designators when we discuss mods.

Jerry,

I modeled your circuit and it indeed does allow you to have near constant rise-time as the supply varies from 6 to 12 volts, but the fall time is still twice as fast at 6V as it is at 12V. I posted the Spice result in my ATS-3A Keying Mods folder.

Hi Joe,

Try this. Create two graphs. One with the zener, and has
R13=1K. The other without the zener, and has R13=0.
For each graph do three runs of the simulator, with V+ at
6.0, 7.5 and 12 volts.

The diode is to give us constant slew rates, so the slope of the
rising and falling edges remain constant. That's not the
same as constant rise and fall times.

Yesterday morning I had a long post that started and ended with:
>I'm not so sure we can do much better without ....
>This would give symmetric and consistent slew rates across
>supply voltage. Note that actual rise and fall times increase
>with the envelope amplitude, not sure how one would best fix this.

That comment still stands with the circuit I posted. Making all
rise and fall times constant would probably take something like
a variable resistor at R101.

At 6 volts, the rising edge runs out of gas. This is especially
true with the diode, because that 1K at R13 means we can only
drive the near end of R101 down to 0.1 * V+ = 0.6 volts above Gnd.
That's getting too close to the transition region of Q4, which
is centered around 3.25 volts below V+. The difference is
6 - 3.25 - .6 = 2.15 volts, so not much current through R101.
On the rising edge we drive R101 at V+, which is always 3.25 volts
above the transition region. Hence, things are not balanced at 6v.

Without the zener, rising edge slew rate gets faster as V+ goes up.
We drive R101 with 0 volts, which is V+ - 3.25 volts below Q4's
transition region. At 6 volts that works out to a difference of
6 - 3.25 = 2.75 volts, while at 12 volts we get 12 - 3.25 = 8.75.
So the 12 volt case slews about three times as fast as the 6 volt
case on the rising edge. Slew rate on the falling edge is the
same at 6 or 12, this is not affected by the zener.

My vote's for including the zener.
Mostly because it gives such a pretty envelope at 12v,
and in spite of the slowing of the rising edge at 6v.
But a lot of the value of the rig is in how simple Steve has
managed to keep it, only including features that really make
a difference. With or without the zener this is much better
than before, and there were apparently very few complaints.

My last posting of March 8 describes a mod that is still an option, is very easy to do, and gives results almost as good as anything descibed above. If you operate at over 10v, and if you don't want to mess with it much, you should at least consider this:

>Removed the two 0.1uF caps at C42, C43 (C53, C54 on ATS3)
>Added two 0.01uF caps from drain to gate at Q4 (Q5 on ATS3)
>Added a 100k resistor across C45 (C56 on ATS3)

The drain of Q4 is the center pin and the big tab, connected to L3. The two 0.01uF caps (or one 0.02uF cap) could be wire leaded, they get soldered directly to Q4, which is very mechanically stable. Just be sure you have the right value, a 0.1uF cap will not work. The resistor (could be anything from 10K to 1Meg) could also be wire leaded, perhaps soldering it from Q4's tab to a ground at the switches. I'd advise against soldering big stuff like 1/8'th watt resistors to chip caps and chip resistors, as they fracture easily (and unnoticeably) under mechanical stres.

Alright Joe, those plots really look nice!
From what I saw on my scope the evening of March 8,
that's pretty much what the RF envelope will look like.

Here's how I would go about the mods. I won't get to this
till sometime next week, perhaps someone else would like
to do the honors:

##################################
Mods for ATS3A keyclick fix, not yet tried.

The new parts you will need before starting are:
C101: 0.01uF SM0805 chip cap (I'd get two, just in case)
R13: 1K SM0805 chip resistor (R14 on ATS3)
R14: 10K SM0805 chip resistor (R15 on ATS3)
R101: 100K SM0805 chip resistor (may change, perhaps to 150K)
R102: 100K SM0805 chip resistor (non critical, 10K to 1Meg)
D101: 6.8volt@5ma Zener, S-Mini, MAZ80680MLCT (may change)
A small piece of mylar tape (there are alternatives)

First, do the mods of March 8, but adding only one 0.01uF cap.

Remove the two 0.1uF caps at C42, C43 (C53, C54 on ATS3)
Add a 0.01uF cap from drain to gate at Q4 (Q5 on ATS3)
Add a 100k resistor across C45 (C56 on ATS3)

Removing the old caps is easily done using two soldering irons.
The 0.01uF cap gets added right on top of Q4's leads, the drain is
the middle pin and the gate is that top outside pin connected to R13.
You might want to not add this cap till after the R13, R14 step.

The 100K resistor across C45 is non-critical, could be 10K to 1Meg,
and is there to keep Q4 leakage from charging up C45 when Q4 is off.

You could stop now, if you add another 0.01 uF cap in parallel
with the one you just put down. The rig should work fine,
and the rest gives results that are small potatoes in comparison.

Remove R13 and R14 (R14 and R15 on the ATS3)
Clean off the pads with solder wick. Wash the area, then put
a bit of mylar tape over those center pads of R13 and R14 that
connect to Q4's gate.

This is a critical high impedance node. The tape must withstand
soldering temperatures, and not absorb moisture. Could use teflon
tape if thats available. Maybe masking tape in a pinch. Other
alternatives would be to "tent" R13 and R14 up in the air over

that middle node, or to cut the copper trace leading to Q4's gate.

Replace R13 with 1K (R14 on the ATS3)
Replace R14 with 10K (R15 on the ATS3)
Add the zener across R14. (across R15 on ATS3)

The zener's end with a bar should be on the end of R14 that
is not connected to R13.

Add a 100K resistor between Q4's gate and the node
joining R14 and R13. (Q5, R15, and R14 on ATS3)

Wash the board, trying not to get water into the switches or
trimmer caps. Dry thoroughly.

##########
Adjusting D101 and R101:

Determine what zener voltage gives the best symmetry at 12 volts.
This depends on actual NDT2955 Vgs characteristics, a higher zener
voltage gives faster fall times. Could fake various zener values
with a string of LED's and signal diodes, remember these would be
pointed in the direction opposite that of the zener. Or just
leave the zener out for now till someone else figures which one
works best.

Then trim the 100K at R101 for the desired rising edge at 12v.
My guess is that we want slower edges, so maybe out around 150K.
But rigs with current firmware shut down the DDS drive to U8
around 7.75 ms after key down. We must guarantee that the envelope
has fallen to zero by then, and 100K is a safe choice in this regard.

##########################

A significant hack, but a lot easier than the initial build was.
If a few people try it and are happy, and if there is interest,
perhaps we could do some kind of group kit.
Probably about a dollar's worth of parts in moderate volumes.

Would be nice if a bunch of us could try this out before Steve
has to decide which way to go on his buy for hundreds of parts.
There may be part variation issues we don't see coming.

In my previous post, a minor error to correct:
>On the rising edge we drive R101 at V+, which is always 3.25 volts
>above the transition region. Hence, things are not balanced at 6v.
That would be the falling edge.

##################################
Mods for ATS3A keyclick fix, not yet tried.

The new parts you will need before starting are:
C101: 0.01uF SM0805 chip cap (I'd get two, just in case)
R13: 1K SM0805 chip resistor (R14 on ATS3)
R14: 10K SM0805 chip resistor (R15 on ATS3)
R101: 100K SM0805 chip resistor (may change, perhaps to 150K)
R102: 100K SM0805 chip resistor (non critical, 10K to 1Meg)
D101: 6.8volt@5ma Zener, S-Mini, MAZ80680MLCT (may change)
A small piece of mylar tape (there are alternatives)

First, do the mods of March 8, but adding only one 0.01uF cap.

Remove the two 0.1uF caps at C42, C43 (C53, C54 on ATS3)
Add a 0.01uF cap from drain to gate at Q4 (Q5 on ATS3)
Add a 100k resistor across C45 (C56 on ATS3)

Removing the old caps is easily done using two soldering irons.
The 0.01uF cap gets added right on top of Q4's leads, the drain is
the middle pin and the gate is that top outside pin connected to R13.
You might want to not add this cap till after the R13, R14 step.

The 100K resistor across C45 is non-critical, could be 10K to 1Meg,
and is there to keep Q4 leakage from charging up C45 when Q4 is off.

You could stop now, if you add another 0.01 uF cap in parallel
with the one you just put down. The rig should work fine,
and the rest gives results that are small potatoes in comparison.

Remove R13 and R14 (R14 and R15 on the ATS3)
Clean off the pads with solder wick. Wash the area, then put
a bit of mylar tape over those center pads of R13 and R14 that
connect to Q4's gate.

This is a critical high impedance node. The tape must withstand
soldering temperatures, and not absorb moisture. Could use teflon
tape if thats available. Maybe masking tape in a pinch. Other
alternatives would be to "tent" R13 and R14 up in the air over
that middle node, or to cut the copper trace leading to Q4's gate.

Replace R13 with 1K (R14 on the ATS3)
Replace R14 with 10K (R15 on the ATS3)
Add the zener across R14. (across R15 on ATS3)

The zener's end with a bar should be on the end of R14 that
is not connected to R13.

Add a 100K resistor between Q4's gate and the node
joining R14 and R13. (Q5, R15, and R14 on ATS3)

Wash the board, trying not to get water into the switches or
trimmer caps. Dry thoroughly.

##########
Adjusting D101 and R101:

Determine what zener voltage gives the best symmetry at 12 volts.
This depends on actual NDT2955 Vgs characteristics, a higher zener
voltage gives faster fall times. Could fake various zener values
with a string of LED's and signal diodes, remember these would be
pointed in the direction opposite that of the zener. Or just
leave the zener out for now till someone else figures which one
works best.

Then trim the 100K at R101 for the desired rising edge at 12v.
My guess is that we want slower edges, so maybe out around 150K.
But rigs with current firmware shut down the DDS drive to U8
around 7.75 ms after key down. We must guarantee that the envelope
has fallen to zero by then, and 100K is a safe choice in this regard.

##############################

A significant hack, but a lot easier than the initial build was.
If a few people try it and are happy, and if there is interest,
perhaps we could do some kind of group kit.
Probably about a dollar's worth of parts in moderate volumes.

Would be nice if a bunch of us could try this out before Steve
has to decide which way to go on his buy for hundreds of parts.

There may be part variation issues we don't see coming.

In my previous post, a minor error to correct:
>On the rising edge we drive R101 at V+, which is always 3.25 volts
>above the transition region. Hence, things are not balanced at 6v.
That would be the falling edge.

Joe,

That's really curious. The rising edge of the 12v curve is not as steep as case 5.
But why? The 2N7000 is on with key down, holding the anode of D1 at gnd.
So D1 does not conduct during that rising edge, rising edge should look
just like case 5. And with key up, D1 will conduct, and the fall times should be
100k/5k = 20 times faster than in case 5.

Maybe you could take the circuit from case 6, remove D1, and run
another set of plots exactly like case 6.

Regardless, this is an interesting possibility.
We could speed up the falling edge at 12v till it's symmetrical with
the rising edge at 12v. We avoid that relatively wierd zener, though
I'd expect it to lose symmetry as we back off on the supply voltage.
On the other hand, we wouldn't lose that 0.6v of headroom when
operating at 6 volts due to the drop across that 1K in case 4.
My bets are still on the zener, but we'll see.

A minor error in my mod notes posted yesterday:
>Then trim the 100K at R101 for the desired rising edge at 12v.

That should be the falling edge. The falling edge is unaffected by the zener.
The rising edge can then be trimmed for symmetry when using a 12v supply
by choosing the correct zener. Once somebody figures out correct values
for R101 and the zener, should be able to stuff all boards the same.

I may be checking out of here most of the day.

Jerry,

I'm on my way out for the rest of the day too, but first a quick comment. The Case6 circuit uses a different FET. It's better behaved for this application than the IRFL9014 that I used at 9V in my transmitter. I tried to model the circuit with the NDT2955 that the ATS-3A uses, but the Spice model I got from Fairchild wouldn't run in my Catena Spice. Maybe someone else can run the sim with this device, as every sim I've done so far (except Case6) was based on the IRFL9014. There's quite a bit of variation in the gate-drain transfer function from part-type to part-type, so if we can't verify it with an accuracte sim, we might have to perfect it on the bench.

Was going to spend the entire day on other things, but it's tough
to stay away from this when ideas come.

Joe, not sure why your simulation failed with the IRFL9014, got it
to work here. Saved images of schematic and the plots generated
in the KE7ER files section under case6*.

The IMRL6302 wants 5K at R3 due to it having a transition region
so near the V+ rail (Vgs of -1.5v), and because bounce in the drain
of the 2n7000 was about -0.75v. This may not be reproducible.
Using the IRFL9014, we see the same variance in rise times
with the case6 circuit as we do in case5. However, trimming for
equal rise and fall times at 9 volts in this way gives a very
good compromise.

I think the IRFL9014 is a fair match for the NDT2955, though Vgs
tends toward -4.1v rather than -3.25v. So the trouble we see in
simulations at 6 volts won't be quite that bad.

Case6 got me thinking about treating rising edges and falling edges
differently.

I've posted two new circuit diagrams and the resulting plots
in the KE7ER files folder. keyclick01 shows the constant slew
rate solution using the zener. I've adjusted it a bit to avoid
the 1K resistor that had reduced our headroom when operating
at 6 volts. Otherwise, it's the same topology as Joe's case4,
gives about the same results.

keyclick02 shows a new approach, this gives nearly constant
rise and fall times across our supply voltage range with very few
additional parts. When the key is down, C2 gets charged through
the rectifying diode to V+ minus the voltage drop across the diodes.
When the key is up, the bottom of C2 is at V+, so the top of C2
will be at twice V+ minus the drop across the diodes.
This extra voltage boost allows us to increase the key up slew
rate to match the key down slew rate.

Again, we choose a zener that gives best rising/falling symmetry
when used with the NDT2955. We scale the drive resistor(s) into
the gate (and perhaps adjust the feedback cap) for our preferred
edge rates.

No attempt has been made to retain the reference designators
from the ATS3 or ATS3A in the keyclick01 and keyclick02
schematics.

Any opinions on the desirability of constant rise/fall times
over various supply voltages? Is it worth a few parts?

Jerry,

My sim problem was not with the IRFL9014, it was with the NDT2955 that's used in the ATS-3A. I couldn't get the Spice library model to work in my simulator.

In any case, I think we've analyzed this thing down to what might be a 'gnat's eyebrow'. The improvements discovered so far are probably more that adequate for the needs at hand, and in many respects look better than some of the commercial rigs I've seen reviewed by QST.

Based on that, I'm going back into retirement on this subject.

1122. Key clicks

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-03-12 15:50:24 UTC
From: Steven Weber
Topic: 800 Message: 1122

Before everyone gets too obsessed with key clicks, consider this from the ARRL Handbook:

"The dots and dashes of a CW signal must start and stop abruptly enough so we can clearly distinguish the carrier's presences and absences from noise, especially when fading prevails. The Keying sidebands, which sound like little thumps when listened to on thier own, help our brains be sure when the carrier tone starts and stops.

It so happens that we always need to hear one or more harmonics of the fundamental keying waveform for the code to sound sufficently crisp. If the transmitted signal will be subjected to to propagational fadding - a safe assumption for any long-distance radio communication- we harden our keying by making the transmitter's output rise and fall more quickly. This puts more energy into the keying sidebands and makes the signal more copiable in the presense of fading - in perticualr, selective fading."

It then goes on to recommend rise and fall times of between 1 and 5 ms.

Personal thoughts:
QRP rigs should have fairly hard keying, since they are already at a power disadvantage. Stock ATS rigs do have fairly hard keying and maybe one reason so many people seem to work DX with them.

Yup, obsessed is a good word for it.
I tend to follow something like this through just to solve
the puzzle. Then I have to back off a bit to reassess what
actually makes sense.

I'm really proud of that jack-in-the-box trick for nearly
constant rise/fall times, but there's not much point in taking
the ATS3* quite that far. It would mostly just add confusion
when kit builders have to debug their cold solder joints.

I think your post Saturday may have described the circuit
I now have in my files section under keyclick00.pdf, giving
constant slew rates. I really like the symmetry it gives,
though doing away with the zener might not make all that
much difference in real life. Hence the "you could stop here"
that I included in my hack notes.

I'm buying a selection of 5ma zeners to try it out, probably
using the circuit of keyclick01. Once it's up, I'll post
photos of the RF envelopes I see on the scope.

If you keep zapping FET's, consider a move here to Oregon.
Seldom have trouble here, even if working on carpets.
All that moss between the toes apparently helps drain the static.

Steve:

Methinks thee ? a valid point.

Put a spectrum analyzer on a typical ATS rig (or several "typical" ATS rigs) and see how wide the clicks are, and how far down (in dB) they are compared with the main signal. A KW+ rig can't have as many sidebands as a 1 or 5 watt rig, because of the 40 dB or so difference in power (is my calculation of dB difference between 1 and 1 KW correct?). To have the same "perceived" bandwidth, the KW rig would need 40 dB less sidebands as a 1 watt rig - i.e. the keying would need to be much softer.

I haven't heard a "clicky" signal on a QRP contest that I can remember - I've heard a few chirps from keyed oscillators, but no clicks. If a KW+ rig were running "hard" keying a few hundred Hz from a 1 watt signal, both coming from the same general geographical area, I'm sure I'd hear more clicks from the KW rig.

1125. Re: Key clicks

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-03-13 05:35:11 UTC
From: radio_kx0r
Topic: 800 Message: 1125

Steve,

I really like the quote from the ARRL Handbook you posted - I read it years ago, and believe it concisely defines the purpose of the keyed wave. It's true that a sharply-keyed wave is easier to copy through noise. The ear does hear it better. It also occupies more bandwidth.

Many years ago I lifted a cathode-keying circuit from the Handbook to use with my class-C 4 X 1625 tube amp. Over a period of time, I played with the circuit to get a better, more symmetric keying waveform. I did the same thing with two other homebrew rigs. I listened to the signals quite a bit, something that must be done very carefully to avoid overloading, AGC, etc. I think 2 ms risetime sounds nice and punchy and 5 ms sounds a bit soft. 1 ms is too harsh for me, and 10 ms is unacceptably mushy. Where we measure the start and end of the rise and fall is also quite fuzzy, because some keying waveforms aren't simple ramps; there are rounded edges and exponential decays sometimes.

I couldn't decide what I really wanted for timing, so I put a little switch on the front of my tube amp: about 2 ms for DX and noisy band conditions, and 5 ms for rag chewing when the band's nice. It's a 200 watt output rig.

The problem with the stock ATS-3A is that when it's run near 12V, there is so much delay in the fall time, that the DDS drive signal gets cut off sharply before the key shaping takes effect. It's so quick I never measured it - too quick. Jerry and/or Joe have seen this too. This is because at the higher supply voltages, the gate of Q4 ends up more negative with respect to the source that it ought to be, and it takes too long for it to come down to the point where it turns off. At 6 to 9 volts the keying is lovely, and this is no accident. I changed R13 from 22K to 56K, and got nice keying at 10-12V, but by doing that I lost the low voltage capability of the rig. I run on 3 lithium cells or 10 NiMH, or my QBSA modified to go to 12V, so I'm OK with this easy mod.

So I agree with you Steve, and if we end up with a fairly simple circuit with rise and fall times of around 2 ms over the full range of supply voltages, that would be great. I do think that the sharper waves are easier to copy through typical QRP conditions, and that is really how most people, including me, are going to use this rig.

I think it's great that this forum has lead to this much work, discussion, and understanding of how these keying circuits actually

work, and this is certainly one of the better sides of our hobby!

I hope my zeal for finding the perfect key click filter hasn't alarmed
too many people. It may be a non issue. The only reports of trouble
I'm aware of come from those of us who have looked it over with a scope,
not from actually hearing objectionable key ckicks on the air. With a
10 volt power supply and below things look perfectly fine. You've
over reacted if you switched to using your 200 watt desktop instead.

If you do run at 12v and cringe at the thought of hard keying, the very
simple fix in post 1086 (further described in 1111) should relieve any guilt.

Having reviewed my last post, a few more comments.

As Carey noted, fall times at 12 volts are more than
hard keyed, they're instantaneous. I jumped on this because
I thought it enough of an issue that it should be looked into
before the next roll in the design.

But if the only people noticing are those poking at it
with scopes, it's not something for current owners to
lose sleep over.

Jerry,

Did anyone do simulation plots at various voltages for the circuit you posted as keyclick00 ? That one looks reasonable and fairly easy to implement, but I can't find the graphs.

Thanks

Hi Carey,

In Joe's folder, his case4 plots keyclick00.
Note that he has adjusted the capacitance to 0.004uF.
I'm not 100% sure, but assume he stayed with 100K at R101.

My keyclick01 circuit (schematic and plot in my folder)
offers an improvement in the rise time at 6 volts by avoiding
the 1K drop across R13 with key down. Performance should
otherwise be virtually the same as keyclick00 given the same
R101 and C101 (I have them at 150K and 0.01uF). When I get
around to implementing this, it will probably be keyclick01.

Those part values are not final. Bringing down the 10K's
makes the slew rates agree better, but increases the current.
Adjust the zener voltage for symmetry between rising/falling
edges. Too large of a C101 will cause that FET to oscillate.

1130. Key Clicks

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-03-13 19:47:42 UTC
From: Karl Larsen
Topic: 1130 Message: 1130

I think the hard work being done to measure the magnitude of the keying on the ATS3 is really not needed. I own one of the early ATS3's and I use it for such things as Fox Hunts DX chases and just the little CW net we have in New Mexico. The power I run at is what 12 VDC provides on 40 Meters and is usually 4 Watts.

To this date I have never been told I have key clicks. Never. The little net is all friends and we do talk about keying and how the rig sounds. One member gets on with his very old rigs that are self excited tubes and such. He is hard to chase around with the ATS3 :-)

So I really don't care what the keying on and off speed is. So long as there are no complaints about key clicks I'm happy with it.

Well, not quite instantaneous, but pretty close to it! Of course, I had intended for the rig to be powered by 9 volts, and didn't pay as much attention as maybe I should have as to what happened at higher voltages.

Maybe I'll solve the problem by adding a 9V LDO regulator the the -B board <G>

Or I could just use an outboard regulator/battery arrangement?

Anyone try to use the unit with an outboard amp for a little
extra output? I know that defeats the purpose but if one
is going to use the Sprint with Steve's base unit, might be nice to
get a little extra power out of it without trying to push it
with 12V. Especially if running at home.

Oh, passed Tech and General test last friday the 9th. I just couldn't
get the studying and my code learn'in done in time to test under the
old rules. Am embarassed I missed 7 on the Tech test and I don't have
the slightest idea which ones. May have been due to the fact my manual
was one addition back. Doesn't matter as I did the General and just
missed 3 questions. Made me feel better. Didn't have access to an
elmer either.

Hi Steve,

The key clicks at 12v are easy enough to resolve.
And any clicks seem to be a minor issue to begin with.

Are you seeing other trouble at 12v, maybe blown finals?
Could be fixed with a line in the manual stating that the rig
is designed for 9v, and while some have reported success with
supplies from 6 to 12 volts such operation is not guaranteed.

It's a big win to be able to operate over such a range, as it
allows us to pick our output power.

A regulator would add an extra margin of safety though, and the
kit builder could choose to not stuff it or to substitute a 12v.

I'm not sure I buy into the argument that clicks help us hear CW. If the signal is weak, the clicks will be below the noise level and we'll not hear them at all. If the signal is strong, we don't need the clicks to help us.

Clicks are really just broadband noise that is generated by the rise and/or fall time of the CW envelope. This extends well out from the carrier but the level falls off rather rapidly. It is at least several dB below the carrier even a kHz or 2 away.

In some listening tests I've done, once a signal gets to the point where it is weak enough to be hard to copy, a further weakening by 20 dB makes it below the noise level. Since clicks are this far below the carrier, I don't think we can hear clicks on weak signals.

On a QRP rig you could probably get away with clicks at -20 dBc. On a 5w signal there would be about 50 mW of energy in the clicks. Doubt that you'd get many complaints from that. Similar clicks on a KW rig would have about 10w of energy. I think I've heard some of those.

We only hear clicks on *loud* signals. They are quite annoying. I'm in the camp that says "The fewer clicks, the better."

FWIW, EMRFD says rise and fall times should be 1 to 2 ms. They even show a recommended wave shape on page 6.64.

I am also of the opinion that clicks fall under the FCC's definition of spurious signals. They need to be below the 'legal limit.' Can't recall what that is right now but think it is -43 dBc?

Let me compare PSK31 signal with CW. The amplitude envelope of a PSK31 signal is designed to suppres effectively any keying sidebands. The two sidebands of an idle BPSK31 signal that are visible on the waterfall are caused only by phase modulation.

If a CW signal of the same dot length 1/31.25s is shaped with the same envelope as BPSK31 signal, the human brain will have great trouble to read it. Some of the sidebands aka key clicks are nescessary. Those keyclicks that span outside the other's receive filter do not contribute to readability, they only bother others. So the ideal CW envelope for QRP would produce little attenuated sidebands say from -150 to +150Hz and attenuate the rest.

Well, it is not that easy, human ears are unconfortable with too sharp envelope.

> I'm not sure I buy into the argument that clicks help us hear CW.
If you have some software able to produce throb digital signal, listen to it. The signal is 1 to 4 symbols per second and shaped by the same envelope as BPSK31, which is raised cosine. You will hear how fuzzy it sounds.

I'm not sure I buy into this argument either. Remember that in CW all
we are detecting is the presence or absence of signal. As I tune the
bands I have no trouble detecting the presence of a PSK31 signal, even
a weak one. It is easily identified by its unique sound.

> If you have some software able to produce throb digital signal,

I'm not sure what a 'throb digital signal' is. Don't think I have any
software like that.

And note that when others have adjusted the rise/fall time to be about
5 ms they did not say they had trouble detecting it. Only that it
sounded mushy. I have no doubt that a crisp edge does make the signal
easier on the ears. But the signal has to be fairly strong to hear
those edges.

With weak signals - the selective fading mentioned in the ARRL passage
- the even weaker sidebands cannot be heard, all we are hearing is the
steady state tone. Perhaps this is one reason so many hams seem to
have trouble hearing weak stations.

From: Larry Makoski
Topic: 1137 Message: 1137

This Sunday evening, the Flying Pigs Amateur Radio Club International will be holding its monthly Run For The Bacon. This is a friendly, two hour QRP CW Sprint, which is open to ALL radio amateurs, will last from 9:00 - 11:00PM EDT (0100-0300 UTC Monday).

You may work stations once per band on 160, 80, 40, 20, 15 or 10 Meters. Suggested starting frequencies are 1.812, 3.562, 7.044, 14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs membership number. If you're not a member of the Flying Pigs, and would like to be; then please click on the "membership" hyperlink on .http://www.gentzow.com/fpqrp/ Otherwise, non-members can just use their output power figure.

You can report your score via the Autolog page which can be found at :
http://gentzow.com/fpqrp/autolog.asp
or you can mail your logs to the address given on the Autolog page. The deadline for logs is March 25th at 2400 UTC.

Hope to catch you on the air Sunday evening!

I wonder if now that we're on daylight time, since the Run for the Bacon starts effectively an hour earlier (relative to the sun and the ionosphere), 20 meters will be worth trying at the start?

I hope some of you try 20M - it's near sunset here at the start of this event, so at least the western half of the country may have some decent activity, at least for part of the Run. 15 meters?? Perhaps.

The time shift should help compensate with the increasing noise and QRN on 80M.

I may try the ATS3A this time.

1139. SMD soldering

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-03-18 17:32:31 UTC
From: Karl Larsen
Topic: 1139 Message: 1139

I bought all the things you need to use the method of sticking all the parts on the front side of the ATS board with solder laden paste. This is the hard part. Then you pre-heat the board for a couple of minutes and then heat it to 350 F for about 30 seconds until all the paste turns to solder and all 100 devices are soldered properly at once.

I am using the Cash Olson method and I made one test board and it looks just great! You can read about Cash's method at:

http://www.zianet.com/erg/SMT_Soldering.html

and I got the embossing heat tool from Hobby Lobby and a one burner stove with a thermostat from Wal Mart and had an old pot. All this cost $20.00 I bought a syringe with solder paste for $5.00 from Cash and the kit I built to practise with cost $10.00.

With an investment of $35.00 I now know that I, a 6'4" 71 year old man can do this! And it is so much faster and safer than soldering each device by hand. I will buy the new ATS3B kit and expect to have all the surface mount devices mounted the first day.

1140. New QBSA problem ?

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-03-18 21:11:11 UTC
From: bantonides
Topic: 1140 Message: 1140

I have been using my QBSA for some time time now with no problems at all.

This morning I was working on 80 meters, all ok. I left the station for about an hour and left everything powered on. When I returned, the freq display was jumping around at random. I checked cables and swapped cables, all were good. I tried other band modules and found all were doing the same thing except the 40 meter module. It was dead on as usual.

The ATS 3 is working fine on all bands. The CW Freq readout is right on, as I checked this using my general coverage rcvr while xmiting into a dummy load on all bands. The ATS changes freqs ok as well.

The fwd & rev pwr functions of the QSBA also seem to be fine.

... Svereal hours later ...

All equipment has been powered off for several hours. Now all bands display frequency that is about 5KHz too low, except for 40 mtrs which is still dead accurate.

Mode switch now does not function. The display is stuck in the KHz display mode.

Has anyone seen this kind of behavior before? All suggestions/ideas appreciated.

1142. March NAQCC Sprint

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-03-20 02:30:26 UTC
From: Larry Makoski
Topic: 1142 Message: 1142

This Wednesday evening, the North American QRP CW Club will be holding its monthly sprint.

Here are the particulars:

Date and time:
Thursday, March 22nd, 0030-0230 UTC
(Remember that's Wednesday evening here in the USA) That's 8:30 - 10:30 EDT, 7:30 - 9:30 CDT, 6:30 - 8:30 MDT and 5:30 - 7:30 PDT.

Bands - Frequencies:
80M - 3555-3565 kHz (Be courteous to FISTS operating on 3558 kHz)
40M - 7039-7050 kHz (Avoid W1AW on 7047.5 kHz).
20M - 14059-14065 kHz. General:
A particular station may be worked once on each band. Operate CW only. All licensed amateurs are invited to participate, but only those operating QRP (5 watts or less) are eligible for awards.

Call: CQ NA

Exchange:
RST - SPC (State Province or Country) - NAQCC Nr.
(non-Members substitute power level for NAQCC Nr., e.g. 5W, 1W, etc. Be sure to add the W.)

QSO Points:
QSO with a Member, 2 points.
QSO with a Non-member, 1 point.

Multipliers:
Each USA state
Each VE province
Each country except W/VE
All multipliers count only once in the contest.

Bonus:
If you use only a straight key for the entire sprint, multiply your score by 2.
If you use only a bug for the entire sprint, multiply your score by 1.5.
If you key with anything other than a straight key or bug, there is no bonus multiplier.

Categories:
SWA - simple wire antennas - for those using a simple wire antenna per NAQCC definition.
GAIN - gain antennas - for those using other than a simple wire antenna.

Special Award:
For the one making the highest score using an indoor antenna. At least
1/2 of the radiating portion of the antenna must be indoors.

Entry Deadline:
All entries must be RECEIVED before 2400Z on March 28, 2007. So submit
as soon as possible, especially regular mail entries.

For further information, please visit:
http://www.arm-tek.net/~yoel//sprintrules.html
To join the NAQCC, please visit: http://www.arm-tek.net/~yoel//joinup.html

Hi,

Would a regulated 0-18V 0-3amp power supply be decent enough to run
the ATS-3A and QBSA units? Got my call yesterday. KC9LDH.
I could select 10V and be "regulated" too.

It should work fine. Personally, I would choose a
fixed voltage supply so that there would be no way to
accidentally put more than 12 volts to the rig.

Congrats on the new call!

Thanks,

I'll be careful. I wonder if anyone has used an amplifier with the ATS-3/3A? I do have a Ramsey Qamp-40, 40 meter unit that I plugged into a Peanut Whistle and it seemed to work fine into my Oak Hills Dummy load. (I was unlicensed at the time so all my working with equipment was through the dummy load and would listen on shortwave on the bench) I am located in an area where using true QRP to start out would not be advantageous. A little extra power might increase the odds of a contact in the beginning. I'm so isolated, I couldn't even get a response off of a good 2 meter repeater at 1700h local time, 1 mile from my house with a 5 watt H/T.:-) Weekends will be better there.

I sometimes use an HFPacker Amp with the ATS-3, but it's usually not
needed for what I want to accomplish. "Isolated" in HF terms is
measured in thousands of miles, so you may find you don't have trouble
making contacts as long as you have a half-decent antenna (namely, a
long enough piece of wire).

Thanks for the info on the HF Packer Amp. The little 35 watt job looks
right up my alley. The 100 watt looks cool but $400.00 is a bit stiff
for me right now.

I also have a 35 Watt HF packer amp, but it is not completely?built yet.? Yet another project that got put on the back burner.?

?

One issue that came up was the input attenuator resistors for the Amp.? I originally bought some big resistors that barely fit?so that I could run the ATS-3 into the amp at 12v/full power operation.? Then it dawned on me that I could just reduce the voltage to the ATS-3, keep the input power down and use smaller attenuator resistors (I am not always the sharpest tack in the box).? Since the ATS-3 is really just an "exciter" in this case, there is no reason to run it at full power.? In addition, I also?plan to use this Amp with my Sierra which only puts out about 2 watts.

?

Anyway, In my humble opinion, 35 watts is good enough, and the 35 watt amp is very compact.? I don't know the current going rate for the HF Packer amp, but it is a very good buy.

Kurt,

If you run your ATS-3A from the regulator in the QBSA, your power supply will need to give about 3 volts more than the output of the QBSA's regulator. So if you set the QBSA to 11 volts, you'll need at least 14 volts input. The ATS-3A should not require more than about 1 ampere - if it is correctly tuned and matched, it may require somewhat less. Efficiency of the rig is high. Please never try to run the ATS3A on more than 12V - even 12V requires a nearly perfect match!

A simple antenna like a dipole, cut for the frequency you plan to use, and hung at least 25 or 30 feet high will get you started. Your isolation should not matter, unless you're down in a deep hole, like a deep canyon. Even in a hole you should be able to make contacts on 80 meters, where signals going up at high angles can connect you to lots of other hams. The higher your frequency, the more important it becomes to be up high, with a clear horizon. Even on 20 meters you don't need a very special location to make lots of daytime contacts.

If you're new to CW, it will take a while to get through the learning curve, but it's worth it. The rewards are lifelong. Weekends and evenings are the best times to find others to contact. CW comes faster to some folks than to others - it took me years to get used to working DXers and contesters, even though I started out as a teenager.

You have to be a better operator to enjoy QRP than to succeed with a more powerful rig. Copying other QRP stations sometimes requires skills which take a while to develop. Give yourself plenty of time. Many of the people in this ATS group are seasoned operators who like the challenge of QRP CW and who enjoy using minimal equipment. Even today I'll admit that some of my best long, solid, ragchew contacts were when I was running over 100 watts with a good antenna and good band conditions. With 5 watts or less you're not going to knock the socks off too many guys, but you will eventually have some amazing QSO's. The ATS3 will work lots a DX when things are right.

25 years ago I built a little mosfet transmitter with a VN67AF and a crystal oscillator. It put out 2 or 3 watts on 40 meters. I wondered if anyone could hear it - this was before QRP was very popular. I ended up working hundreds of stations on 40 meters over time - I used to get on at about 22:30 local time, and there were more old timer CW ops active back then - I rag chewed for hours with those wonderful people, and most of them were amazed at how well they could hear the mosfet. They would have signed off if they couldn't copy.

My antenna was a ridiculous end-fed wire hung a few feet above my roof and over the TV antenna. It was 20-30 feet high. I used a little tuner to match it to the mosfet amp. It got out real well, particularly to the eastern and western USA - simple one-hop contacts. It was not a DX system, but it made contacts. I used an SX28 receiver I've had since I was a kid, so I had very good ears. It was such a joke to look at the big monster receiver with 15 tubes all glowing, and that little minibox mosfet transmitter! That was the magic of QRP.

Please be sure that your antenna is carefully matched to your ATS-3A. Since you have the QBSA, you can check the reflected power. It must be very low for the transmitter to operate properly. You would be smart to use a tuner or matching network of some kind to adjust your system so the reflected power is low. If you try to use one antenna for several bands, you'll need a tuner for sure; you may need a balun also. Depending on what you know, it may take quite a while to learn about antennas and matching networks...most of us are still busy learning about them.

Good luck and 72/73! Congratulations on your new call.

Kurt,

The propagation characteristics of HF and 2 meters are very different.? For 2 meter repeater operation, you need a nearly flat take off angle and something close to line-of-site to hit a repeater, particularly with 5 watts.? FM is not a very efficient mode.? If you live down "in a hole" in a remote area?it is hard to do much with 2 meters (without a big tower).

?

For HF, even a take off angle of 30 to 40 degrees (or higher)?will give you good chances of contacts over a large region.? CW is extremely efficient.? I recommend that you give QRP a try - it really works, even in remote areas. It is amazing what you can do on a simple wire antenna at 5 watts.

?

Not to say there is anything wrong with QRO operation.? I started out operating at about 50 watts.? But there is something really satisfying about making contacts at 5 watts or less, particularly on a rig that you built.? Looking back, I wish that I could say that I made my first contact at QRP, but I can't.

?

Thanks,

I'll be careful. I wonder if anyone has used an amplifier with the ATS-3/3A? I do have a Ramsey Qamp-40, 40 meter unit that I plugged into a Peanut Whistle and it seemed to work fine into my Oak Hills Dummy load. (I was unlicensed at the time so all my working with equipment was through the dummy load and would listen on shortwave on the bench) I am located in an area where using true QRP to start out would not be advantageous. A little extra power might increase the odds of a contact in the beginning. I'm so isolated, I couldn't even get a response off of a good 2 meter repeater at 1700h local time, 1 mile from my house with a 5 watt H/T.:-) Weekends will be better there.

1151. QRP Homebrewer Sprint

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-03-23 23:51:38 UTC
From: Larry Makoski
Topic: 1151 Message: 1151

Just a reminder to everyone that this Sunday evening is the Spring edition of the Homebrewer Sprint.

While the contest is open to everybody, our purpose is to promote the use of homebrewed equipment, whether it be built from scratch; or a kit ..... it matters not. QSO points will be higher depending on just how much homebrewed equpiment you happen to be using.

The time is Monday morning, March 26th from 0000-0400 UTC; or on Sunday night, March 25th from 8:00 until Midnight EDT. Both CW and PSK-31 are encouraged, and the suggested frequencies for operation are the "watering holes" for QRP CW or PSK-31 on 80, 40, 20, 15 and 10 Meters.

The suggested call is "CQ HB" and the exchange is RST / SPC / Power Out

For further contest details please visit:
http://www.njqrp.org/data/qrphomebrewersprint.html

I must admit when I saw the size of the parts in the ATS 3-a kit I had serious doubts that I would be able to successfully build this rig.
As it turns out I was wrong! with a little time,patience and the right tools combined with some help along the way I have managed to get my 3A on the air.
First off I used Cash Olsen's method of soldering the SMD (which I would highly recommend) and while everything looked good I was having difficulty in powering up the rig. Upon close inspection I found a couple solder bridges on the chips which I removed but still nothing. I sent the board back to Steve and he discovered that there were some chip legs which were floating. These were corrected and I had the board back in a few days. I think the initial problem was not using enough solder paste for the chips..
Now the rig powered up but there was no tx...Again I double checked everything and then found out that I had failed to wind and solder in L3 on the main board. 5 minnutes and that was fixed now the rig was working perfectly!
I heard HC2SL calling CQ on 20m he answered me on my first call and gave me 599. I told him I was QRP and he said that was an honest 599 and vy strong. Since last night I have worked ZF2,UA0,UA9, HB9 and OK1 all with similar results.
This Little gem of a rig has certainly brought back the fun and excitement of years gone by. I want to thank everyone for their help and guidance making my first SMD project a great experience.
Thanks especially to John W2AGN, Petr OK1RP and to YOU Steve KD1JV for letting all of us share in your truly amazing ability to design and package all these features into such a small rig that actually works..

Hi John,
I live in Las Cruces, NM and Cash Olsen lives here too. I found the
Embossing Heat Tool in Pink at 1/2 price :-)
The low heater is a one burner electric from Wal Mart. I did a cheap kit
and was amazed how well Cash's method worked. It turned out the heating
is the easiest part. Getting it all stuck in the paste is the hard part...

You don't want to use too much paste on those tiny 40 legged devices
but if you do just use some desoldering braid and it's fixed. I agree
you needed a little more paste.

I bet Steve missed that L3 was missing. It's just so easy to do
things wrong.

John your experience is just like all of us. The receiver is hot
and the power out is a full 5 watts. I'm going to buy a ATS3B this
summer and like you do the top side with Cash Olsen's method and then
finish it up. Having 17 and 15 meters will be a lot of fun as the bands
start to get better.

But the main reason is because I love these tiny radios!

1155. Re: [AT_Sprint] FS:ATS3a

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-03-30 11:00:34 UTC
From: Pete Meier
Topic: 1155 Message: 1155

I have an ATS3a for sale.
The main board is complete, running and receiving quite nicely. Two modules - 20 and 80 meters are complete and working, 30 and 40 are in the parts bag. Using 9 volts from a regulated, adjustable power supply and some clipped-on wires to a dummy load I was seeing around a watt or so out on both band modules.

Here's the deal: Spring is here, home projects are piling up, Dayton is around the corner and I'm just not going to have time to pursue this project further for some time. Therefore I'd rather pass it along to someone else to complete and to make this happen I am asking only $145 plus shipping and will throw in a nice Whitman's Chocolate tin to mount it in. The Whitman tin is about the same size as the Altoids tin but a little deeper. My ATS3 is mounted in one and I found it has a bit more room to work with. The manual on CD is included, of course.

Please contact me direct if interested.

Richard:

I very much know how you feel. Worked my first DX on my new ATS-3A today -- ON7G -- also on 30. (This, my first QRP DX QSO, looks like it will easily qualify for 1,000 miles/watt!) "Wow! What a kick!" seems to sum it up very well.

Have fun, Richard! And, while I'm at it, thanks again to all who helped me along the way!

1159. BPSK31 on ATS-3A - proof of concept

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-04-08 12:22:01 UTC
From: Vojtěch Bubník
Topic: 1159 Message: 1159

Hi gang.

After many weekends of work I have managed to let the stock ATS-3A transceiver transmit nice BPSK31 "cq ok1iak". The firmware of ATS-3A was modified to allow serial line control, which is performed over the DASH paddle pin in straight key mode. That means paddle will not work if in remote control mode. To enable both remote control and paddle would need hardware modification of the stock ATS-3A.

The only way to shape the BPSK31 envelope on a stock ATS is to key the transmitter on/off. The envelope is far from raised cosine, but the signal is not wider than of CW and the sidelobes will be hopefuly negligible at QRP levels. I tested common windows PSK31 programs how they will cope with that non ideal envelope. MIXW32, MultiPSK, DigiPan and PocketDigi worked well, WinPSK had occasional drop outs. Here is the screenshot of BPSK31 signal received on RadioShack DX-398. On the lower part of the screenshot the receiver may have been overloaded.

http://www.kufr.cz/~ok1iak/temp/BPSK31-ATS3A.png

Here is how it sounds. You may try to decode it yourself.
http://www.kufr.cz/~ok1iak/temp/cq-ok1iak-ats3-bpsk31.wav

RTTY or MFSK16 modulation patterns may be generated by ATS perfectly. Olivia uses symbol shaping, but I bet hard keying like in the case of MFSK16 will work good enough.

The serial line hardware protocol is 1200Bd asynchronous, 8bit, 1 start, one stop bit. Because I am targeting mainly handheld computers, the serial stream is generated by a sound card in the BELL 202 format and transformed to the 0/3.3V digital levels by an external FSK decoder. The two tones are 1200Hz mark and 2200Hz space. The tones are converted to 0V for space and 3.3V for mark. I did not implement ATS support into PocketDigi yet, I only wrote a simple C++ application to generate WAV sound files with various commands. Those WAV files may be played on a PC, Pocket PC or even on a mobile phone or MP3 player.

I will be happy to provide modified ATS-3A firmware source or binary, the windows wav generator source or binary or command wav files to anyone wanting to experiment. The prerequisity is to be able to flash the firmware. For introduction to ATS firmware flashing look at http://w1mt.qrpradio.com/ats3.html

I will work on PocketDigi support now and I hope to make some PSK31 QSOs when I visit my parents' house. I do not have any antenna possibility at my appartment. BTW I will try to pursue some student at my alma mater - the Czech Technical University to port PocketDigi to a java enabled mobile phone as his master diploma work.

Now to the tone decoder. I built only decoding part of the following schematic http://www.qsl.net/yo5ofh/projects/xrmodem.gif . The analog FSK demodulator chip from Exar XR2211 is readily available and cheap. The value of C5 is too big, I decreased it to 4N7. I connected pins 6 and 7 to provide muting if there is no signal on the line. Without input signal the DASH pin is low and ATS-3A is configured to straight key / remote control on

startup. I connected two red LED diodes to pin 7 to pull the maximum output voltage to 3.3V.

The XR2211 decoder is analog, which means it is sensitive to component tolerances. I do not have much experience with analog circuits and I had hard time to tune it. Tone generator is very handy, there is a bunch of free PC sound card tone generators on the internet. Connect LED to pin 5 to indicate phase loop lock. This will help to avoid tuning the oscillator above space or below mark tones. Put LED on pin 6 to indicate decoded tone. The transition frequency is geometric average of the two tones, sqrt(1200*2200)=1625Hz.

This is a picture of my prototype. The black plastic box is half empty and the tone decoder will be much smaller if made in SMD. The tone decoder sources cca 4mA. The small bread board above the plastic box is a MAX232 level convertor to monitor the FSK decoder.

http://www.kufr.cz/~ok1iak/temp/xr2211-ats3a.jpg

There are following alternatives to the XR2211 FSK decoder. MX/FX614 chips are expensive (about $10) and hard to get, but they consume only 1mA at 3.3V. They are digital, no tuning is nescessary. Daugter board mounted on the opposite to the band filter will fit inside the altoids tin for sure.

Other possibility would be to decode pulses instead of tones, which would need only input level converter with single op amp, or even just the internal comparator of MPS430 (this would mean hardware mods to the stock ATS3). Imagine sending short plus/minus pulses to the sound card. Logical one will not send any pulse, logical zero will send short plus/minus ripple. Average value will be zero. The pulse will be deformed and it will ring for a while, but if the pulse is lot shorter than the bit slot, it will hopefuly ring out in the same slot. This approach is similar to the SIR infrared hardware layer. I hope to find time to experiment with it.

The last possibility is using serial line of the PC. This would work for remote control for sure, but to modulate DDS directly means exact timing on the control line, which is hard to do on multitasking operating systems. There are multimedia timers on Windows though, which shall enable timing with 2msec precission. That shall be good enough. There are no multimedia timers on Pocket PC. I do not know about Linux.

The remote control protocol I implemented works in two modes - command or modulate. In command mode the commands are packed into frames similar to Icom IC-V protocol. The frames start with FE and end with FD. The first payload byte is command, then 0 to 6 data bytes may follow. The payload bytes are in BCD format, the A to F nibbles may not appear inside the payload. I implemented the following commands. The protocol is very alpha and will certainly change.

01 -
Beep morse characters. Just for testing the connection. The format of morse characters is the same as used by the firmware internally.
An example packet "fe 01 05 10 0f 17 fd" will beep "ahoj".

02 -
Set frequency, reset RIT/XIT state. Frequency is sent by 4 BCD bytes, lowest digit first.
Command "fe 02 23 98 01 07 fd" will set the frequency to 07,019,823Hz.

03 -
The same as 02, but additionaly it will announce the new frequency by AFA on success.

04 -
Set XIT offset and start BPSK modulation. The transmitter will be off until the first modulation command.
The XIT offset is sent by 2 BCD bytes. Negative offsets are sent in 9 complement format.
Command "fe 04 34 12 fd" will start BPSK modulation at +1234Hz,
Command "fe 04 99 99 fd" will start BPSK modulation at -1Hz.

After the command 04 is succesfully decoded, serial line will no more respond to command frames, but to single byte modulation commands.
00 - End of modulation, stop TX and return to command mode.
01 - Key up, but stay in modulation mode. Used to simulate raised cosine amplitude envelope.
02 - Set phase to 0 degrees, key down the transmitter.
03 - Set phase to 180 degrees, key down the transmitter.

The UART is implemented using interrupts and timers, so it works in background and does not consume additional power. Baud rate is derived from the 32768 clock resonator. I had to comment out some original code to make place for remote control. Callibration code is not needed after the transceiver is callibrated. DFE or tune modes are not nescessary too. If instead of the 4k MSP430 chip the 8k variat was used, it would all fit nicely. Maybe the ATS-3b will be fitted with more FLASH?

1160. Modulator for the ATS3

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-04-08 14:22:01 UTC
From: Terry ONeill
Topic: 1160 Message: 1160

Anyone have a circuit for an add-on modulator for the ATS3?

1161. April NAQCC Sprint

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-04-10 01:06:37 UTC
From: Larry Makoski
Topic: 1161 Message: 1161

This Tuesday evening, the North American QRP CW Club will be holding its monthly sprint.

Here are the particulars:

Date and time:
Wednesday April 11th, 0030-0230 UTC
(Remember that's Tuesday evening here in the USA) That's 8:30 - 10:30 EDT, 7:30 - 9:30 CDT, 6:30 - 8:30 MDT and 5:30 - 7:30 PDT.

Bands - Frequencies:
80M - 3555-3565 kHz (Be courteous to FISTS operating on 3558 kHz)
40M - 7039-7050 kHz (Avoid W1AW on 7047.5 kHz).
20M - 14059-14065 kHz. General:
A particular station may be worked once on each band. Operate CW only.
All licensed amateurs are invited to participate, but only those operating QRP (5 watts or less) are eligible for awards.

Call: CQ NA

Exchange:
RST - SPC (State Province or Country) - NAQCC Nr.
(non-Members substitute power level for NAQCC Nr., e.g. 5W, 1W, etc. Be sure to add the W.)

QSO Points:
QSO with a Member, 2 points.
QSO with a Non-member, 1 point.

Multipliers:
Each USA state
Each VE province
Each country except W/VE
All multipliers count only once in the contest.

Bonus:
If you use only a straight key for the entire sprint, multiply your score by 2.
If you use only a bug for the entire sprint, multiply your score by 1.5.
If you key with anything other than a straight key or bug, there is no bonus multiplier.

Categories:
SWA - simple wire antennas - for those using a simple wire antenna per NAQCC definition.
GAIN - gain antennas - for those using other than a simple wire antenna.

Special Award:
For the one making the highest score using an indoor antenna. At least 1/2 of the radiating portion of the antenna must be indoors.

Entry Deadline:
All entries must be RECEIVED before 2400Z on April 17, 2007. So submit as soon as possible,

especially regular mail entries.

For further information, please visit: http://www.arm-tek.net/~yoel//sprintrules.html (http://www.arm-tek.net/%7Eyoel//sprintrules.html)
To join the NAQCC, please visit: http://www.arm-tek.net/~yoel//joinup.html (http://www.arm-tek.net/%7Eyoel//joinup.html)

Run for the Bacon
Sunday April 15, 2007
6:00 pm - 8:00 pm
(This event repeats every month on the third Sunday.)
Location: Your shack or anywhere

Notes:
This Sunday evening, the Flying Pigs Amateur Radio Club International will be holding its monthly Run For The Bacon. This is a friendly, two hour QRP CW Sprint, which is open to ALL radio amateurs, will last from 9:00 - 11:00PM EDT (0200-0400 UTC Monday).

You may work stations once per band on 160, 80, 40, 20, 15 or 10 Meters. Suggested starting frequencies are 1.812, 3.562, 7.044, 14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs membership number. If you're not a member of the Flying Pigs, and would like to be; then please cli

From: agfmdy
Topic: 1165 Message: 1165

Hi,

Anyone try the ATS-3A with a 35 watt HF packer amplifier?
I thought it would be nice to add for base operations if
conditions were lousy. The packer I guess and take the 2 to 2.5 watts
and boost it to 35. Got a hotplate, heatgun and a cheap SMT kit am
going to try the Olsen method of construction on first before tackling
the ATS-3A.

Kurt,

Never used anything over 5 watts myself so can't speak
for the amplifier part of your questions BUT...

I just built an FCC-2 board (Norcal sells them) using
Cash Olsen's paste and an Oster convection oven I
bought at Costco. This is a double sided board and was
my test case into the fast construction method for
SMT. I populate both sides of the board and it worked
like a charm, highly recommended. I did put an
electrolytic cap on backwards but was able to use an
embossing gun to heat it up and flip it around. Worked
like a champ!

Unless I run out of paste I will never again solder
SMT with an iron. Only thing you need the iron for is
to help wick any solder bridges off the small pitch
pins.

You will like using the hot air method!

I don't have an ATS-3A, but I have an ATS-3, and I often use it with the HF-Packer Amp. Running the ATS-3 on 12 volts overdrives the amp (I built it with the standard attenuator, so it wants 2-2.5 watts in). Running the ATS-3 on a 9v battery works well with the amp, and I built a 9v regulator into a mini mint tin, with Anderson Powerpole input and the proper plugs for ATS-3 and ATS-2 on the output, so it's convenient to run off a gel cell or power supply too.

Because I use the amp in CW traffic nets, I made a mod to my amp to provide "semi-QSK". I think you can find it in the forum on the HF-Packer Amp site. Basically, I used a center-off DPDT switch in place of the standby/on switch, to alter one of the resistances in the timing circuit that controls the DC-DC converter and the antenna relay. Up is standby, center is semi-QSK, down is VOX-with-hang.

Mike, how does this work for something relatively large (like an NC2030)? (After some practice, of course!)
I'm wondering if you need to poplate the whole board in one session, and get it into the oven before the paste dries out? Or can you spread the populating over a week or more, and then cook it once? Or can you do it in sections, cooking each one as you go?

Bill,

The solder paste is Kester 256. It's tack time is 8 hours soooo, I would mount it all in one session then cook. I think even an NC2030 could be done in 1 session.

Don't know if you can do part of the board at a time. I wouldn't think that repeated trips to the oven would affect the parts already mounted as long as you watch your temperature profile each time (which you have to do anyway). BUT I have not done that yet so proceed at your own risk. Perhaps someone else knows?

I do know that those rework stations are just hot air so that leads me to believe that if you keep the temperatures in the proper range you should be OK with multiple cooking sessions.

Anyone done it this way?

The trick is doing just that, not just keeping watch on
the profile but ensuring the temperature is the same
across the board. I suspect that would be difficult
to do in a toaster oven, you may end up roasting one
part of the board waiting for a cooler spot just to
reflow. Semiconductors usually have a reflow profile
you should adhere to which limits temp rise rate and
peak temperatures, again, which would be difficult
in a frypan or toaster oven. Hot air would seem to
be the best option in a multi-stage assembly scenario,
at least that way you're not overcooking the parts
that don't need it. Maybe you could come up with
a process that you reflow all the (less heat sensitive)
passives at once in the oven, and put all the semi-
conductors on by hand. Having assembled boards by
both methods I can't see how the paste/oven method
offers any useful benefit, but I guess that all depends
on how proficient you are with an iron and SMT.

I used the Cash Olsen method when I built my ATS-3A. I mounted the SMT parts over the course of 3 days always keeping the board in the fridge in a plastic box to maintain the temp of the solder. It soldered together perfectly and I had a very professional result. One thing I would recommend is that when you apply the rope of paste on the chip pads use enough! you can go back later and wick everything off the chip legs all solder that will be left will be almost impossible to see but will be there under the legs and that's where you want it. I also found that the beverage warmer is too small for the ATS-3A board instead I used the warming plate on the coffee maker which was just the right size

Two modules - 20 and 80 meters are complete and working, 30 and 40
are in the parts bag. Using 9 volts from a regulated, adjustable
power supply and some clipped-on wires to a dummy load I was seeing
around a watt or so out on both band modules.
>
> Here's the deal: Spring is here, home projects are piling up,
Dayton is around the corner and I'm just not going to have time to
pursue this project further for some time. Therefore I'd rather pass
it along to someone else to complete and to make this happen I am
asking only $145 plus shipping and will throw in a nice Whitman's
Chocolate tin to mount it in. The Whitman tin is about the same size
as the Altoids tin but a little deeper. My ATS3 is mounted in one
and I found it has a bit more room to work with. The manual on CD is
included, of course.

1175. PSK with ATS3A, success on the air

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-05-01 19:53:40 UTC
From: Vojtěch Bubník
Topic: 1175 Message: 1175

Hi gang.

In my previous posting, I described my first tests of BPSK31 signal and ATS3A.
http://www.kufr.cz/~ok1iak/temp/bpsk31-ats3-proof-of-concept.htm

During the last weekends, I extended PocketDigi to modulate BPSK31, BPSK63 and QPSK31 on ATS3A. The interface and protocol is described in my previous posting.

I tested it on the table first. The signal is not as clean as if it would be generated by a SSB transceiver, but I found worse signals on the air. Most of the commonly used PSK software received that non ideal BPSK31 and BPSK63 signal without any problems. The exception is QPSK31, which was decoded only by MixW, but nobody is using QPSK31 on the air anyway.

I had a first chance to try it on the air this weekend. My PSK31 setup is very portable now, but I aim to make it even smaller.
- Stock ATS3A with a modified firmware
- FSK Bell 202 decoder (receiving part of BayCom modem, half the size of Altoids tin, see my previous post)
- 2xLiPol 1800mAh battery
- Z-match
- iPaq 3630 Pocket PC computer
- foldable infrared keyboard
- LW antenna

I made about 10 QSOs on 40 and 80m, most of the QSOs on the first call. I did not receive any complaints about signal quality, I suppose that the sidelobes are below noise if using QRP levels. I checked temperature of the finals after each longer QSO and the finals were only warm.

Wow! The first PSK31 transceiver in Altoids tin, giving 2 watts with 80% efficiency on two LiPols. Anyone wants to experiment?

The next steps will be RTTY and other MFSK modes (MFSK16, Olivia, Contestia) and simplification of the interface board. I hope to replace the external FSK decoder by a single Op Amp and firmware extensions. I hope to fit the interface board in the main Altoids tin one day.

73, Vojtech OK1IAK

KD1JV is now 55 miles into hike of Appalachian Trail. He doesn't mention whether or not he's able (or has the energy) to get on the air, but this page has recently been updated:
http://www.trailjournals.com/entry.cfm?id=177227

The date at the top is wrong - I believe it is generated by the website automatically.

Has anyone worked him?

I worked Steve during the QRPTTF last Saturday when I was operating as
WQ8RP. That was April 28, so the dates must be wrong on the blog.
Later he sent a note from a motel saying that he had a sore ankle from
his hiking shoes, and was taking a rest day.

1178. Portable bag for ATS tcvr

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-05-13 13:01:06 UTC
From: Petr Ourednik
Topic: 1178 Message: 1178

Hi folks,

if anybody is interested in the nice and rugged bag for portable operation of ATS tcvr then lets try to check two of them I bought for myself. See Photos section > ATS bags folder.
First of them is even more rugged and bit smaller > good to put inside an Altoids box.
Second is bit bigger to put inside even headphones and maybe battery...

I bought for myself both types and works fine for me. As I bought few pcs more they are available...

Price is $6.99/each + shipping.

Let me know if You are interested in that bags.

So where we will go next with our ATS famous radio?

73, Petr OK1RP

1180. May NAQCC Sprint

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-05-15 02:20:25 UTC
From: Larry Makoski
Topic: 1180 Message: 1180

This Wednesday evening, the North American QRP CW Club will be holding its monthly sprint.

Here are the particulars:

Date and time:
Thursday May 17th, 0030-0230 UTC
(Remember that's Wednesday evening here in the USA) That's 8:30 - 10:30 EDT, 7:30 - 9:30 CDT, 6:30 - 8:30 MDT and 5:30 - 7:30 PDT.

Bands - Frequencies:
80M - 3555-3565 kHz (Be courteous to FISTS operating on 3558 kHz)
40M - 7039-7050 kHz (Avoid W1AW on 7047.5 kHz).
20M - 14059-14065 kHz. General:
A particular station may be worked once on each band. Operate CW only. All licensed amateurs are invited to participate, but only those operating QRP (5 watts or less) are eligible for awards.

Call: CQ NA

Exchange:
RST - SPC (State Province or Country) - NAQCC Nr.
(non-Members substitute power level for NAQCC Nr., e.g. 5W, 1W, etc. Be sure to add the W.)

QSO Points:
QSO with a Member, 2 points.
QSO with a Non-member, 1 point.

Multipliers:
Each USA state
Each VE province
Each country except W/VE
All multipliers count only once in the contest.

Bonus:
If you use only a straight key for the entire sprint, multiply your score by 2.
If you use only a bug for the entire sprint, multiply your score by 1.5.
If you key with anything other than a straight key or bug, there is no bonus multiplier.

Categories:
SWA - simple wire antennas - for those using a simple wire antenna per NAQCC definition.
GAIN - gain antennas - for those using other than a simple wire antenna.

Special Award:
For the one making the most 20 Meter QSOs.

Entry Deadline:
All entries must be RECEIVED before 2400Z onMay 23, 2007. So submit as soon as possible, especially regular mail entries.

For further information, please visit:
http://www.arm-tek.net/~yoel//sprintrules.html
To join the NAQCC, please visit: http://www.arm-tek.net/~yoel//joinup.html

Jonathan,

:) good question! My ATS is now unassembled as I decided to re-housing to new box. New facelift should be more rugged and band modules will be connected externally. So at the time I made the pics of the bags I had not the radio to put inside to demonstrate how it fit...

What I can do is to make pic with empty Altoids to have an idea.

This Sunday evening the Flying Pigs Amateur Radio Club International will be holding its monthly Run For The Bacon. This is a friendly, two hour QRP CW Sprint, which is open to ALL radio amateurs, will last from 9:00 - 11:00PM EDT (0100-0300 UTC Monday).

You may work stations once per band on 160, 80, 40, 20, 15 or 10 Meters. Suggested starting frequencies are 1.812, 3.562, 7.044, 14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs membership number. If you're not a member of the Flying Pigs, and would like to be; then please click on the "membership" hyperlink on .http://www.gentzow.com/fpqrp/ Otherwise, non-members can just use their output power figure.

You can report your score via the Autolog page which can be found at :
http://gentzow.com/fpqrp/autolog.asp
or you can mail your logs to the address given on the Autolog page. The deadline for logs is May 27th at 2400 UTC.

Hope to catch you on the air Sunday evening!

Pete,

Please see Steve's post # 851 as well as # 592 & # 864 (per Mike M1MT). If your QBSA kit is recent, you may not need to worry about the display freezing (#851), since Steve fixed the firmware.

If you know what you're doing and like taking risks, you can modify your QBSA to give a maximum output of 12V instead of 11V. This will let the ATS rig deliver close to 5W, but it's risky. Steve chose 11V for a reason - he doesn't want you to damage your rig. If you run on 12V, you must have an accurate 50 ohm load (which the QBSA will tell you). It's also smart to do any tuning of antennas or matching networks at low voltage. Use a tuner like the BLT that has a resistive bridge, so your ATS rig is not subjected to severe mismatch during tuning. Read the relevant parts of Steve's ATS manual carefully.

I have a post in the FILES section describing a way to get 12V from the QBSA, but if you understand 3-terminal regulators like the LM317T, you just change the components in the ADJ terminal circuit to get what you want. You can tailor the voltage range as you like. If you run on 12.0V, you'll need to supply 15.0V or more (under full load) to the QBSA power input to avoid regulator dropout. You should check for this.

There also are keying issues discussed on numerous other posts here. The keying issues get worse as the supply voltage is raised above 11V, and I don't recommend you run on 12V, unless you modify the keying circuit in your rig.

These various mods are slightly technical, so you probably should just leave everything the way Steve intended, unless you like tweaking things and have perfectionist tendencies.

The QBSA is a really nice unit and an amazing value for the features it provides. I put mine in an extra BLT case I happened to buy when they were still available separate from the BLT. It is quite snug in there. There is more work required to drill and fit the case than to assemble the QBSA itself. Plan your case construction somewhat before you start soldering your QBSA.

I think you'll be delighted with your QBSA if you work carefully!

Good luck - 72/73

1188. 12V Operation of ATS Rigs

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-05-25 19:28:31 UTC
From: radio_kx0r
Topic: 1188 Message: 1188

I'm wondering how many other ATS-rig operators run on a 12V supply?

This question has come up in relation to the QBSA, which normally goes up to 11V. We also touched on this when we discussed the keying issues that appear at the high end of the supply range.

Has anyone damaged their rig running at 12V or higher (shudder). When I run at 12V the output mosfets get warm, and so do the toroids in the output filter, especially on 20M. This is with a verified 50 ohm load. I can see the output drop on the QBSA as I hold the key down. (I try not to do that often.)

Has anyone run at 12V for a long time with no issues? I've put some time on my finals, but not as much as some of you.

Please post any comments pro and con...

72/73

I use 6 Hawker Energy Cyclon sealed lead-acid 2volt 2.5AH batteries which gives me 12.5-12.6 volts. I have not encoutered any problems whatsoever. My particular rig does not put out quite 5 watts but it does into the mid 4 watts, depending on the band and freq. Use this info for what it's worth, but It works for me.

1191. 11.7 Volts from Lithium Ion Cells?

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-05-31 22:54:08 UTC
From: Hank Greeb
Topic: 1188 Message: 1191

Has anyone used 3 Lithium Ion or Lithium Polymer cells? These have 3.7 volts each, and 3 of them would have 11.1 Volts.

They have a tricky charge cycle, but if you treat them right they last a very long time. They're used extensively for model airplanes, Cell Phones, laptop computers, etc.

Steve, the SMD was a lot of fun on my ATS2. You might enjoy my article on the ATS2 project. Go to:
http://www.al7fs.us/AL7FS5ATSprint2.html

I sold my ATS2 and now have to "get off the dime" and build my ATS3 (not the a version). I liked the plain ATS3 as it can be used to check into a SSB net...at least I think it can. We shall see.

Best of luck. Remember...one part at a time and the project is simple.

Hi Steve,
You don't have to hand solder the parts. Check out these websites. You can mount all the parts with soldering paste and "bake" the board in a toaster oven! I personally haven't tried this because hand soldering SMT parts is very relaxing for me, I much prefer it over through-hole parts, no flipping the board over and no clipped off leads to deal with.

http://www.zianet.com/erg/SMT_Soldering.html
http://www.hpsdr.com/Public/Projects/SMT/SMT.html

I've built two ATS-3A's (sold one and built one for another ham) and one ATS-3 (currently own), I will build the '3B when it comes out. I say go for it whether you intent to hand solder or bake, you'll be glad you did. It's fun to show the radio to your friends and watch them ooh and aah at your ability to build with such tiny components. Just don't tell them it's not that hard and fun too.

Hi Jim and all,
I've used -3 to work crossmode, checking into the special event station at Oshlosh. Great fun and it works well. The offset is adjusted automatically. Just tune in the ssb signal and the transmitted cw is right on freq.. I hope Steve retains this capability in the 3B.

Good to hear from you Jim, C'Mon Sunspots!!

I love this radio stuff!

Steve, the SMD was a lot of fun on my ATS2. You might enjoy my article on the ATS2 project. Go to:
http://www.al7fs.us/AL7FS5ATSprint2.html

I sold my ATS2 and now have to "get off the dime" and build my ATS3 (not the a version). I liked the plain ATS3 as it can be used to check into a SSB net...at least I think it can. We shall see.

Best of luck. Remember...one part at a time and the project is simple.

Thanks! Any specific type, maH, etc? Is there much difference in power output with 11.1 volts vs 12 volts?

How many operating hours can one get from a bank of cells which will fit in a second Altoids tin?

Steve,
I built my ATS-3 at age 73 using no special tools or aids other than reading glasses and an OptiVISOR (flip-up, head-band magnifier). Oh, I also used a toothpick and very fine solder (I think it was 15 mil). Of course, you need fine tweezers, too. Be careful not to blow or sneeze on the work as the chips will fly away if you do. You'll love the rig when you get it done!

I use just two cells pack of LiPols, that is sold in model shops to power airplanes. ATS-3 gives about 2W, the finals are cold and I am on the safe side.

Both my ATS3 and ATS3A are now on two LiPo packs running a max V of around 8V. My ATS3 ran for 2 years on three LiPo packs - no problems. They were 300 maH. When I finally zapped one, I went for two 650 maH packs - in the Altoids box with the xmtr. I get about 3W out most of the time, and that's PLENTY. My ATS3A uses 200 maH packs to save weight for the Spartan Sprint, which I won in March and April. As long as I don't call CQ too much, the 200 maH packs run solid for two hours.

These solid state, self-resetting overcurrent protectors look ideal
for the ATS3. I think they would be ideal companions for Li-Po packs
where srious currents could flow.

Hank,

I have used a 950 mAh 3-cell packs and gotten in excess of 6 hours from them. I get a full two hours from 2-cell 250mAh packs for the Sprints. I haven't played serious in the sprints for a while but those 25mAh packs are ideal for two hours.

One thing I would highly recommend for a non Spartan Sprint pack is getting packs that have balancing capability. Then use either a balancer with your charger or use a special charger that can handle the balancing directly. Obviously for the sprints you probably don't want the extra weight of a balancing port.

My personal opinion is that the 3-cell packs are about as much voltage that I want to power an ATS unit with.

Hope this data point helps...

Hank,

I run my ATS-3A on 3 lithium ion cells, which give a maximum voltage, fully charged, of just over 12V. These are CGR 18650C cells rated at about 2150 mAH. I employ a protection circuit (commercial PCB) and a polyswitch. Charging is done by a voltage-regulated, current-limited charger.

If you use lithium-ion or lithium-polymer you should read the data sheet for the batteries you choose, and follow the various recommendations. Be sure your battery pack contains a protection circuit to prevent overcharging, overdischarging, and overcurrent.

The CGR 18650 cells are used in many notebook computers and will provide more operating time than you probably need with your ATS-3A. They are too large and heavy for the sprints, where you might care about size and weight. However, three cells would be fine for serious hiking or backpacking where you want quite a few hours of QSO time.

The ATS-3 amd 3A need to be modified a bit to deliver nice keying waveforms at 12V supply. There are a lot of other posts and files here to help with that.

Another real nice combination is 8 AA NiMH cells, which will give over 10V fully charged, and about 9.6V over most of the discharge. These are cheap and widely available at about 2500 mAH. If you make your own pack, get cells with tabs. AAA cells are also available at about 1000 mAH. They all need a special charger for best results, but they are not as picky as lithium ion cells. The ATS radios have more safety factor when run below 10V.

Good luck -

Expect the power output to be roughly proportional to the square of the voltage. 12V would give you about 16% more power than 11.1V, maybe 0.75W more.

The biggest issues with these are the Rmin of 0.31 ohms (a tenth of a volt or two drop in our application during Tx) and they recover to a bit higher Rmin after tripping. But they certainly would provide a measure of protection and the automatic reset would be handy in a field environment.

Hi Steve,

No. The ones that went "south" on me simply puffed up. This occurred because I do not have any protection circuitry, they were aging, and I ran them down too low. This has only occurred on the 200 and 300 maH LiPo's. None of my larger batteries have yet to fail.

Hi Steve,

I use LiPos exclusively in my QRP rigs when operating portable. If you decide to use NiMH AA's instead, keep in mind that you will need more cells to provide a given voltage than with any other AA-from factor chemistry. I've compared a few battery types here: http://www.ae5x.com/compare%20mAh.htm

Regarding the potential for overheating/burning in LiPo cells, most of the cases where this has occurred have been in R/C applications where the battery is supplying current at or near its peak rated output. I have a motor (http://www.hobby-lobby.com/brushless-uberall.htm) that pulls 18 amps from my the same make and model LiPo battery (2100 mAH) that I often use with my KX1. Its max discharge rate is 31A (50A intermittent) and does get warm in R/C use but when powering the KX1, I doubt the battery even knows it's being used.

Hi Gang, I use LiPos in my Yaesu VX2R HT and my laptop and my cell phone. What do these devices have in common? They have a chip inside them that charges the LiPos battery. You put in 5 Volts DC about and the chip sets the charge rates.

For my radios I use NiMH AA cells. I run 12 volts to my ATS-3 from 10 of the AA cells in a nice Mouser battery case. These 2200 mAH cells will run a ATS-3 all day in a contest.

I recommend the NiNH AA cells because Wal Mart sells a charger that works in your car or home, charges 4 at once and costs $18.00. They are Grey in color and do fast charge with real success.

Have Fun, 73 Karl K5DI

Hello Karl and Gang,
I use a 12 volt 2.3 aH gell cell for my QRP rigs - it can be charged direct from the cigar lighter socket in my car and no special charger needed. I do like the NiMH batteries though - they are fairly lightweight. Been wanting to build up a few 9.6 volt packs and a charger for them to use with my Icom 703 but never have tarted rounding up the parts - oh well, maybe one day ! Anyone know of a schematic for a simple 9.6 volt NiMH charger ?

Most of the major manufacturers of lithium ion cells prevent their distributors from selling individual cells, because of risks and liability issues. Lithium ion cells can store and deliver enough energy to cause fires and injury, if they're not managed correctly. Some of the cells available at various battery sellers on the internet may come from lesser manufacturers overseas, and they may carry more risks than the cells from the big guys. Be sure you use a protection circuit for any pack you build.

There are several suppliers of lithium polymer (LiPO) packs on the internet, and most of these are sold for R/C (model radio control) hobbies. These batteries have great specs and are favored for competitive R/C applications like high-performance airplanes. They are way better than what you need for a QRP rig, and the prices are reasonable for the smaller packs. Be sure you use a charger designed to charge whatever battery you use. Lithium packs must not be overcharged, over-discharged, reversed, or discharged at too high a rate. Read the fine print and don't cheat. Always charge in a safe place, away from flammable material, with a safe charger. Think about what might happen if the power goes off during charge with no one around; will the battery dump into your charger and burn something up? Don't even think about using clip leads or open wires connected to a lithium pack - it's too easy to have a short-circuit accident. Polyswitches can prevent a lot of trouble.

When we take radios to the field, more problems happen - connectors get stressed, radios misbehave, matching circuits don't match, we sometimes forget to connect the antenna, the antenna falls down, we plug in the wrong plug in the wrong hole, clip leads somehow get reversed, etc. Please be sure to protect your radio from accidents - the one or two tenths of a volt that a polyswitch takes when the key is down will never be missed, but good batteries can take out your finals and even the traces on your pcb if there's no protection.

Many of the accidents that have happened with lithium ion cells have occurred when people were building or rebuilding battery packs. Think about how easy it is to have a short circuit with perhaps 100 amps flowing, just because you slipped with a soldering iron and bridged a couple of points in the cramped space of a battery pack. What if you goof in the part of the wiring that's not protected? If you choose to do this, read up on it first, and use discipline so you leave little to chance. Most of what you read will be full of warnings and disclaimers. It's probably just as dangerous to work on a lithium ion pack as it is to work on your house wiring.

Please be careful...

KX0R

Well, I was wanting the cells to rebuild an existing pack - an old laptop battery pack to be exact. Would the lithium polymer cells be compatible in this application ? The laptop is an old one and on its way in shipment. It will be used for amateur radio applications only and I don't want to spend a bunch on it. The battery pack isn't all that important as long as it will run on the AC adapter, but having battery capability would be nice if I can do it without spending a fortune. I have noticed that some of the AC adapters for laptops are rated at 12 volts. Has anyone ever tried running a laptop on a 12 volt battery plugged direct into the power jack ? Sounds logical or am I missing soemthing here ?

Rick,

I doubt that the lithium polymer cells would replace lithium ion in an older pack, because they have different shapes, often flat and rectangular instead of cylindrical cells. You might be able to substitute a complete pack if you find something that will fit or plug in with a cable. The voltages must match closely, but you might be able to do that.

If the computer is designed to run on a voltage range that includes 12 volts, you might be able to run on a 12 volt battery. You should be OK if you match the voltage the AC adapter puts out. All the lithium packs function over a moderately wide range, usually about 4.2V down to 3.0V per cell. This means a 3-cell pack would deliver about 12.6V fully charged, dropping to about 9.0V at the end of safe discharge. These voltages differ among various cell chemistries, so you have to read the data sheets for the batteries you have.

I think rebuilding a pack is dangerous. It's very easy to create a short with your pliers and other tools. A careless short circuit might weld instantly....then you have to run, because things will get too hot and something bad will happen real fast! The problem is that the cells are always on, and you can't safely discharge them to work on them. If you discharge the cells well below 3V, they may be permanently damaged. You might be smart to work outdoors and wear safety glasses if you choose to work on any lithium packs.

The people who build packs do it according to procedures that minimize errors and risks. They know their game.

It might be smart to use the services of someone who knows how to service lithium packs, instead of taking such large risks.

Jerry,

A PolySwitch is a kind of resettable fuse. It's also a thermsitor with a really steep curve. It has a low resistance at low current. If enough current flows through it, above its threshold, it heats up, raises its resistance several orders of magnitude, and the current drops to a low value. It resets if the power supply volatge is removed.

These are used in battery packs, in radios, and in automotive electrical systems to control shorts or excessive currents. Some people use them to protect speakers from burnout, in case someone cranks up an amp too high or goofs otherwise. They are cheap and effective, but you have to choose one that matches the voltage and current you want to protect. The polyswitch should be rated to carry at least twice the normal operating current to avoid tripping when nothing's wrong. If you select too high a current rating, it won't trip fast enough when you need it to protect. It's a judgment call, just like with a fuse.

Here's a link to one of the manufacturers' sites:

http://circuitprotection.com/polyswitch.asp

They have some resistance, but so do fuses and fuseholders. They'll save your day when you goof up and short some power leads together.

It's easy to wire one in series with the B+ line of your QRP rig. I put one in my ATS3-A, right on the board. I had to cut a trace and solder it onto the two leads.

These are available from various distributors in both through-hole and SMT versions, with a wide range of ratings. They are epoxy-dipped and they look like ceramic capacitors. The ones made for battery packs are flat with ribbon leads meant for spot-welding when the packs are assembled.

You can play with them and verify that they work, but they should not be used for intentionally repeated tripping, since they degrade a bit if they're tripped often.

They're worth their cost if they even trip once...especially connected to a high-energy battery.

1219. FS: ATS-3 - fully assembled and ready to sprint

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-06-05 19:38:49 UTC
From: Greg
Topic: 1219 Message: 1219

FOR SALE: one fully assembled ATS-3 with the NR4E filter mod ($175 shipped CONUS).

I cannot believe I am parting with this jewel, but I have used it exactly TWICE in a year and a half. Also, I'm gathering my coins for a used, barebones K2 later this summer so I'm getting rid of a few toys.

I am the original owner and purchased the kit from Steven Weber, KD1JV in 2005. W1RT/John D'ausilio generously agreed to build it for me and did a beautiful job despite my pestering him to near death. It is enclosed in an Altoids mint tin and comes with all four (assembled) band modules and a power cord with Anderson power pole connectors.

Cashier's Check, Postal Money Order or Paypal. Send inquiries to me (not the group) at k4ko@charter.net

Thanks,

73

Pardon me, but I'm a newbie to the ATS-3 - I've researched the 3a. I'm more than likely interested!

If it hasn't sold yet, tell me what the difference is between the 3 and the 3a.

If you don't wish to bother with a newbie, I'll understand. I'm prepared to send the price via paypal as soon as I understand what the difference is.

Well,

I have a chemistry lab here with some real good
equipment, so I might as well use it. The Leica scope
will be real useful for board inspection and/or
repair. Dan Tayloe posted a bit about a USB
microscope that might work pretty well - I think it
was on the qrp-l group. You know, my magnetic
stirrer/hot plate combos here in the lab might work
pretty well - the heating is even and the ceramic top
gets quite hot.

1230. NAQCC June Sprint Spectacular

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-06-11 02:01:21 UTC
From: Larry Makoski
Topic: 1230 Message: 1230

This Tuesday evening, the North American QRP CW Club will be holding its monthly sprint.

Here are the particulars:

Date and time:
Wednesday, June 13th, 0030-0230 UTC
(Remember that's Tuesday evening here in the USA) That's 8:30 - 10:30 EDT, 7:30 - 9:30 CDT, 6:30 - 8:30 MDT and 5:30 - 7:30 PDT.

Bands - Frequencies:
80M - 3555-3565 kHz (Be courteous to FISTS operating on 3558 kHz)
40M - 7039-7050 kHz (Avoid W1AW on 7047.5 kHz).
20M - 14059-14065 kHz. General:
A particular station may be worked once on each band. Operate CW only. All licensed amateurs are invited to participate, but only those operating QRP (5 watts or less) are eligible for awards.

Call: CQ NA

Exchange:
RST - SPC (State Province or Country) - NAQCC Nr.
(non-Members substitute power level for NAQCC Nr., e.g. 5W, 1W, etc. Be sure to add the W.)

QSO Points:
QSO with a Member, 2 points.
QSO with a Non-member, 1 point.

Multipliers:
Each USA state
Each VE province
Each country except W/VE
All multipliers count only once in the contest.

Bonus:
If you use only a straight key for the entire sprint, multiply your score by 2.
If you use only a bug for the entire sprint, multiply your score by 1.5.
If you key with anything other than a straight key or bug, there is no bonus multiplier.

Categories:
SWA - simple wire antennas - for those using a simple wire antenna per NAQCC definition.
GAIN - gain antennas - for those using other than a simple wire antenna.

Special Award:
This month the top two NAQCC highest scorers in the Simple Wire Antennas category will win prizes! First place wins Dave Ingram's wonderful book, "The World of Keys" while the second highest placing NAQCC member will earn a copy of Dave's book, "Keys II: The Emporium". Dave K4TWJ is a 'card carrying" member of the NAQCC and we thank him for his generous donation of one of the books. The other book was procured using funds donated to the NAQCC.

REMEMBER: You HAVE to be a NAQCC member to be eligible to win one of the books; and there's still plenty of time to join before Tuesday night's sprint. To join the NAQCC, please visit:
http://www.arm-tek.net/~yoel//joinup.html

Entry Deadline:
All entries must be RECEIVED before 2400Z on June 19, 2007. So submit as soon as possible, especially regular mail entries.

For further information, please visit:
http://www.arm-tek.net/~yoel//sprintrules.html

1231. SMD/SMT concern

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-06-11 12:48:24 UTC
From: Andrew O. Ojwang
Topic: 1231 Message: 1231

Hello all,

I just noted the concern of several people regarding SMD/SMT soldering.

I have done SMD/SMT work before successfully the manual way, all
I need to make the work easier is another soldering iron with a
suitable ground , a fine solder tip, and table-top magnifying glass.
And of-course plenty of rest, exercise, and good food.

The CW issue has always been that the key I have is bad, given to me
from the ARSK in bad taste as well, and have to purchase my own
keyer, brass key, or bug.

The equipment was always loaned from ARSK to me in bad taste, so must
purchase, build my own equipment.

73,

Hi Lee,

I purchased a $10.00 kit that uses Surface Mount parts and I
soldered it using The Cash Olsen method. Now the details are this:

1. It is as hard to put the SM parts into the paste as it is to get
a part and hold it long enough to manually solder it. You loose parts to
their ability to fly into space, and other problems.

1.1 At Wal Mart I found in the hobby shop a set of 4 tweezers that
are too good to be true! I think they cost like $8.00 and are the best
thing around for getting the part from a bowl to the board in another bowl.

2. But once you have all those parts stuck in the paste in about the
right place the Olsen method will cause the parts to orient themselves
right (move) and it does all 100 of them at the same time! Then Cash
told me and I have not done it, but he says then do the back side the
same way! It seems that the pre-heat of 200 F does not soften the solder
on the front side, and when you start final heat on the back side it
takes so much time to heat the front from the back, it never happens.

3. I think I will try it.

I second that emotion: I, for one, was worried about my lack of expensive equipment to do the kind of kung-fu soldering the fellas were describing. I plan to attack with a fine tip, dorky magnifying glasses, and a big bowl of bran flakes beforehand for stamina. I just got my Rock Mite in the mail today, and if the PCB is 40% as tiny as the AT3B, I think I'll make it. (audience laughs)

Date: 2007-06-16 20:54:26 UTC
From: Larry Makoski
Topic: 1236 Message: 1236

Are your darling wife and dear kids having trouble deciding what to give you for Father's Day? Tell them that you'd like a 2 hour block of "quiet time" on Sunday night so that you can enjoy the June edition of "Run For The Bacon"!

This Sunday evening the Flying Pigs Amateur Radio Club International will be holding its monthly Run For The Bacon. This is a friendly, two hour QRP CW Sprint, which is open to ALL radio amateurs, will last from 9:00 - 11:00PM EDT (0100-0300 UTC Monday).

You may work stations once per band on 160, 80, 40, 20, 15 or 10 Meters. Suggested starting frequencies are 1.812, 3.562, 7.044, 14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs membership number. If you're not a member of the Flying Pigs, and would like to be; then please click on the "membership" hyperlink on .http://www.gentzow.com/fpqrp/ Otherwise, non-members can just use their output power figure.

You can report your score via the Autolog page which can be found at :
http://gentzow.com/fpqrp/autolog.asp
or you can mail your logs to the address given on the Autolog page. The deadline for logs is June 24th at 2400 UTC.

Hope to catch you on the air Sunday evening!

You can be sure an announcement will be made here. Steve often lets us know when he's getting close- i.e. boards on order, waiting for backordered parts, etc. That said, It's always a good idea to watch his site for other tidbits as well.

My guess would be late next month, or sometime in August. (I love to be proved wrong by things happening sooner, though.....)

Actually, probably more like September - just to give myself some wiggle room. I'm still trying to catch up with back logged work which piled up while I was gone hiking for some seven weeks or so.

But I did find time to revist my -B board layout and found I could fit the 28 pin version of the MSP430 on there. And a little 0.2" SMT LED 7 seg display on the top of the board. I did have to resort to using some 0604 sized resistors though. These are used for the current limiting of the LED segments and port pull ups, as I had to remove the resistor pack to make room for the 28 pin MSP.

I think it will be worth having the display for freq readout, even though it reads out one digit at a time. Plus, I'll be using the version of the chip with 10 bit A/D, so will be able to read battery voltage too.

I will also use the 8K memory version of the chip, as some of that will be needed for the display routines. That will leave enough memory available for those who want to add even more features. Finally, this chip has built in hardware UART, but the pins it comes out on are used to drive the display. Not really a problem, just means two segments will flash if it is used for something. (Visual indication it's talking)

It maybe possible to connect the audio output to the A/D input used for battery voltage monitoring to decode digital signals and use the UART for communications to a PDA or pocket PC. However, this is a bit beyond my meger programming abilities, so something like this will have to be done by one of you more knowlegable programmers :-)

I plan to order a few prototype boards of this new version of the rig soon, along with starting to collect parts. Then I can start working on the new manual, which is one of the more time consuming parts of the job.

Hi

Having worked DM2LB who was using an ATS 3 rig (excellent signal quality)I have been following the mail and intend to purchase an ATS 3b when it comes out (save one for me!). Sounds like it will be an autumn/winter project! First of all I will need to get in some practice on SMD soldering as I have not tried it before. I will also need to find the appropriate optical aid to enhance my fading vision - any ideas / recommendations?
In the mean time I thought I might try to learn about the MSP430 as I haven't had any experience of using microprocessors / PICs etc to control radio equipment.

Is there a good on-line tutorial on using / programming the MSP430? Is there a computer simulation for this device?

The 2007 Summer 20 Meter Foxhunt Season is fast approaching!

And we are in need of QRPers to volunteer to for Foz duty!

This summer, the hunts will run on Thursday evenings beginning on July 5th and will run until September 9th. This will provide us with 10 weeks of Summer QRP Foxhunt fun and excitement. There will be, as usual, two hunts per Thursday evening over the ten week period. A bare minimum of 10 volunteers is needed, however, the more the merrier; and we willl consider all who offer to volunteer. Please consider volunteering ESPECIALLY if you've never tried before! You are guaranteed to have the time of your life!

To fill out an application and for all the particulars, please visit: http://www.qrpfoxhunt.org/

Tally Ho! Let the hunts begin!

QRP Foxhunt Committee

Jim,

Take a look at the eZ430-F2013:

www.ti.com/ez430

It is a very inexpensive tool that plugs into a PC USB port and comes
with CD with documentation and a C compiler. There is also a Yahoo
group where you can follow the adventures of other people. I have had
some fun with this and you can do a lot with it. You may also check
out the web page for their design contest:

http://www.designmsp430.com/

some interesting applications.

Have a great day,

Joey

For close optical work with middle-aged eyes, the best "bang for the buck" is a pair of strong reading glasses, available at many stores like Walgreen's, etc. These actually deliver better images than the various visors, and they're much more comfortable. The cost is low. Try before you buy. I keep a couple of different strengths at my bench.

For inspection of tiny SMT joints, just use a hand magnifier of 4X to 10X, or perhaps a microscope, if you want to go first class.

Some digital cameras can be used in macro mode as microscopes. The camera is connected to the computer, and the computer monitor is used to view the enlarged image. A stand or tripod would be required. Otherwise just take macro closeups with the camera, and look at the images with your computer monitor.

Years ago I was riding my bike and found a pair of junk binoculars in the street. This was a gift from on high. The two 35mm diameter objective lenses became the best hand magnifiers I've ever seen. I use them almost every day. With a wider field of view and better correction than most low-cost magnifiers, they're very pleasant to use for inspection. Only problem is they're not "hands free".

Tool suppliers, like Techni-Tool www.techni-tool.com and Stanley Supply www.stanleysupplyservices.com have a selection of magnifiers and other tools for assembly and inspection. I don't like the big single-lens magnifiers at all, but some people seem to. It's a personal choice. Try before you buy.

A bright light is also necessary. This is personal, but don't skimp. I use 160 watts of fluorescent lamps right over my bench, just above head level. This is two 2 X 40 watt shoplights end-to-end. Good quality triphosphor lamps reduce fatigue and improve color perception compared to the crummy cool white tubes, which deliver poor color balance. I also use a reflector spot lamp for close work or special situations.

Even people with good eyes need a pair of strong reading glasses for enjoyable close work. I'd have never got into deadbug homebrew without my first pair - you absolutely need close stereo vision to do work like that.

Get good tools and enjoy the hobby - more true the older you get.

Another thing you can do is put the board on a
scanner.
On my Linux box I get incredible magnification with
the high resolution images. Great for inspection..

1253. DX with AT Sprint

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-06-24 16:24:25 UTC
From: Andrew O. Ojwang
Topic: 1253 Message: 1253

Hello,

Can anybody volunteer their experience with QRP DX(say over
800miles/1200km) using the AT Sprint.

I would be looking for:

1. Output power you used.
2. Antenna system.
3. Band.

73,
Andrew(5Z4FT/KI4LTH) :-(

Hi Andrew,

ATS3 is an excellent DX rig with a very clean an low noise reception.
You can work split easely.
>From Germany I have worked so far with ATS3 + Dipole 12m up among
others :
40m: K(1,2,3,4,8,9),5A,8Q7,BD5,HC8N,A7,4X,TA,3B8,YI
30m: 4S7,5A,K1,K3,YI
20m: K(1,2,3,4,8,9,0) JA,UA0F,JT
You may notice sometimes that you hear DX with less QRM than with other
receivers.

1257. QRP Work(from DX with AT Sprint)

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-06-25 14:37:27 UTC
From: Andrew O. Ojwang
Topic: 1257 Message: 1257

Rob,

Yes I monitor a couple of other QRP lists.

If the responses to my post's are conclusive I generally do not reply.

I also never close the posts of some-one else.

You will only appreciate QRP if you can build your own equipment to use.

There is enormous satisfaction of seeing your own home-build
equipment working as it should.

With QRP home-brew work you will find many times things do not work,
and you will spend around these.

On the current market there are the following popular QRP kit radios.

1. Elecraft Series.
2. Smallwonder Labs series.
3. MFJ QRP series.
4. Wilderness Sierra.
5. Tramp 8 by the DL QRP project.
6. Those offered by Hendricks QRP kits.
7. The Pixie, and Tixie are also popular.
8. The Vectronics series.
9. The AT Sprint series.
10. The Softrock TX/RX series.
11. The Somerset range by Walford Electronics(UK)
11. There are several other QRP radios available commercially, the
best bet is to check the links on one of the popular QRP club sites.
12. There are many circuits to choose from on personal QRP sites
through-out the world.

Be aware that many personal QRP schematics can only be copied, and
made once, but that does not prevent you from developing the circuit
further, at your own cost, which means you will have to publish your
findings to stay legal.

I suggest if you really want to enjoy QRP start by building a
conventional direct conversion receiver, then build a simple
super-het to gain experience, then build a single-band QRP
transceiver, and move up to a multi-band transceiver, and a more
complex antenna system. You will also need to budget for accessories,
or build your own.

Budget is not the only constraint for QRP work, an important factor
for QRP work is you enjoy learning new things in the art of Radio

Communications. If that is so QRP is for you.

If you just want to operate QRP get the Yaesu FT-817, that also works well.

The ATS is good, but I assure you the SMD/SMT work will eat-up your
tolerance, patience, and eye-sight.
If you do not enjoy the build, then you may be disappointed by operating it.

Thanks for the replies to the DX with AT Sprint post.

73,
Andrew(5Z4FT/KI4LTH) :-\

1258. Soldering iron tips: can it be too fine?

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-06-28 01:53:40 UTC
From: kc7fys
Topic: 1258 Message: 1258

I'm using a 20W soldering iron with a power attenuator that brings down the heat according to my needs. Anyway, I replaced the tip with the finest one I could find. The point is rather slender and pointy--and I find that especially when soldering SMCs (I assembled the QBSA last night in a marathon session that wore out my eyes) the tip isn't hot, but back about 3.5mm the iron is plenty hot. This creates a situation where I can't get the heat precisely in that spot I need it. Especially when mounting U6, I ended up with a couple touchy solder blob bridges that were hard to resolve. I wasn't having luck with solder wick (I used coax braid), as it seemed too cumbersome. I ended up in there with my solder sucker, which has about a 2.5mm diameter hole in the tip--not quite precise enough for this. Anyway... knock on wood... things went well.
My question is--are folks using a conical soldering iron tip, or is there another shape that's ideal for soldering these tiny components?
Jonathan

I like using a small conical tip, or if you can find one a tiny chisel tip (there is one on the Pace soldering station at work). I like to keep the temperature of the tip high and work fast. Sometimes a small tip requires holding the iron on the piece longer than I like. I've built two ATS-3A's, one ATS-3, the QSBA, FCC-2 and Norcal SMT Dummy Load, all hand soldered. It's my preferred method. That said, here are some links to the solder paste/toaster oven method:

You would need a higher wattage heater element to run those needle point tips. Try a 50w minimum heater. Metcal makes some nice power supply/irons but they are 300 bucks used and over $500 new for a Metcal 500 station.

So to work with a small wattage heater, stick with tips that are small at the tip but not so long that the heater can't keep up with the demand of the soldering task. 700 or 750 is a good temperature, nothing more needed. If you have liquid flux, use it as it will help the solder flow much better than just the solder's flux core can alone. Use lots of flux and wash the board later in whatever you need to remove all the flux. Water based flux/solder is much easier to clean up later rather than rosin. You can even run your boards through the dishwasher and they will come out sparkling clean. Really. If you use water soluble flux/solder, do NOT leave it on the boards over night ever. It is corrosive. Same goes when it comes time for cleaning, wash the crap out of the boards to ensure 100% of the flux is washed out from under the surface mount components. If you use rosin, use tons of alcohol to wash the board until there is not a trace of sticky feeling to anything. Iso-Heat gas line anti freeze is 100% alcohol and washes boards excellent. Blow dry all boards with the air hose, there will something to blow dry on either wash method even if it looks dry from sitting around. Surface mount components are like a wick holding liquid under them very well.

Soak the coax braid in rosin to make it work very well for wicking solder. The rolls of de-solder wick are expensive so you have a great idea using the coax braid.

You will need to order the $5.00 syringe of solder in a paste and the heaters and your set.

All cheap and effective.

Karl

1264. QBSA Frequency Counter

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-06-30 02:42:40 UTC
From: kc7fys
Topic: 1264 Message: 1264

My QBSA functions well reading f/r power. Still futzing with the FX counter. I connected one wire to the freq counter in, another to G, and looped a test lead half a dozen times around my main QRO rig feedline (dialed back to about 6W) and connected each end to the two freq counter leads on the QBSA. I stll get a 000.0 reading. This is my first experience using a frequency counter; am I on the right track?
Thanks,
Jonathan

1265. Re: [AT_Sprint] QBSA Frequency Counter

Topic: 1264 Message: 1265

>and looped a test lead half a dozen times around my main QRO rig
>feedline (dialed back to about 6W) and connected each end to the two

Apparently, you have a well shielded dummy load. If you have a "T"
connector, put that in line and put a short wire into the open end of the
"T", then put your lead from the counter near that.

From: Steven Weber
Topic: 1264 Message: 1266

Oh, an even easier way to do it is simply pass the transmitter through the QSBA board and when more than a couple of watts passes through it, the counter should pick up enough signal to work, even with out any wire connected to the counter input.

From: Steven Weber
Topic: 1264 Message: 1268

Gang,

The prototype boards for the -3B arrived today and wasted no time starting to populate one. It's pretty much finished and no major problems so far, but there are a few things which need to be fixed (like calling out a via when it should have been a pad - via's have solder mask over them while pads don't)

Now I can start on the new software to add in the single digit frequency display. That's right, the 3B has a little 0.2" LED 7 seg display above the Freq up button to read out the frequency. It will also read out the battery voltage, which should be handy.

Now the question is, how should the readout work? Making it show the digits at the same rate as the morse announciation would be the easiest. I may also make it read out when you stop tuning in auto step mode. Make it blink at 1 kHz points? Option to turn it off to conserve batteries?

I like having the digits at the same rate as the annunciation. I assume having it read out when you stop tuning would also cause an annunciation. If so, I would not want that. Nor would I want a readout a 1kHz points if it included an annunciation. Being able to turn it off is very desirable.

Fb Steve!

The LED is an outstanding idea. 3 out the four possibilites do it for me, blinking isnt necc for me but others may like it.

Another thought might be have the option of outputting the freq to a counter similar to the method on the QBSA. Anyone know of a really small 4 or 5 digit lcd display that could be used with a small enclosure, similar to a Whitmans?

Fine design Steve, can't wait... Thank you for such great innovations.

My personal preferences have changed over time and now
I would prefer to not have a visual readout... I would
prefer to not have a display at all, instead provide
an option to add one for those that want it via a
serial output line. I have come to prefer the
simplicity of the rig with audio feedback. Easy access
to a few empty ports would be preferred over digital
display.

That said, I will buy whatever you come up with! :)

Steve- on the LED display-

1. I think having the display readout at the same rate as the Morse annunciation would be good.

2. Having it readout after tuning stop would also be good.

3. Blinking at 1 kHz marks- not needed. That's what the beeps are for.

4. Ability to disable it entirely - priceless.

As a related aside- If these small smt displays work out, I'd like to see you offer a new version of your Digital Dial module using these. Should make a nice small footprint model possible.

Oh yeah... one more thing. Bring the 3b proto to Lobstercon, OK? (please...) Hope to see you later this week.

My version of the firmware only beeps at 1 kHz marks in split mode, I
belive w1mt's version has it beep during normal tuning also.

>4. Ability to disable it entirely - priceless.
>
Yes, I think this will be required.

I've also thought of a few other uses for the display -
1. read out the keyer code speed
2. blink segments when in keyer memory entry mode to show when the letter
and space timeouts occur making keying in messages without mistakes easier.
3. Indicate the number entered while in DFE mode.

I may provide quicker access to some of the memu functions also, like DFE
and tune mode. This would be done in a similer fashion to how the keyer
memories work - click the menu button, then quickly click one of the other
3 buttons.

Now that I've gone to the 8K memory MPS part, there's pleanty of program
space for adding things like that.

>As a related aside- If these small smt displays work out, I'd like to
>see you offer a new version of your Digital Dial module using these.
>Should make a nice small footprint model possible.
>

I've been thinking of that, but these are single digit displays, though
they do come in dual digits. Either way, thier non-mulitplexed, so running
tacks between them all and not resorting to a 4 layer board might be a
problem.

>Oh yeah... one more thing. Bring the 3b proto to Lobstercon, OK?
>(please...) Hope to see you later this week.

On the proposed Digital Dial, I was speaking of a single-digit readout version. If you counld find a nice (cheap/small) version of the TIL311 (or similar) with built-in hexidecimal decoder, you could even do it with a 8 pin SMT micro, for a super-small overall package.

Cool...

Mike- IIRC, the 3a was $155.00 (+/- $10).
I would expect the 3b to cost a bit more for the 2 added band modules,
and new led readout.

Mike:

At whatever price, it will be a bargain.

As Bruce, N1RX said, it probably will be a bit more than the 3a, but certainly less pricey that the Elecraft K3. :)

My concern is that I've never built a Surface Mount Kit, so I may bollix up the building job to such a point that it's irreparable. I did successfully bid on a SMK-1 from NorCal, and I'll try building it before I try the ATS-3b.

Sounds like most people so far want the option to turn it off. I'm trying to understand what real benefit it provides for any function. I would rather see a rotary encoder for frequency control before I'd bother with a single digit character echoing what I'm already hearing in my earphone anyway.

> so running tacks between them all and not resorting to a

What's wrong with a 4 layer board? Or even 6? Would be nice to route signals between ground layers and provide beefy power and ground planes.

The currently available SMT Dummy Load and Tuner Upper from NorCal QRP club are simple SMT kits to get some first practice with as well. And they are pretty cheap ($7.50 / $10), in case you do manage to mess it up.

Steve,

- A 3 digit led display would be nice. Would 3 digits consume too much power? I'd gladly pay for the convenience.

- It would be nice to have different display modes:
1. Completely off to conserve power.
2. Display on when it is polled for the frequency or when it reaches 50 khz points.
3. Complete on when power is available.

In any case, I'm eagerky awaiting the release of the -3B !

My guess would be US$160-180 inclusive of DX USPS Airmail shipping,
for custom's acceptance at the DX destination.

Steve has already stated the '3b price will be $190 USD. I assume that,
as in the past, that will include domestic shipping. DX shipping/
customs fees will be additional.

Good idea Jerry. I was going to use the DP on the display as a power on indicator, but instead will use it to show split modes are active.

I now have the frequency and battery voltage display working. I belive I will add the ability to have morse+display, morse only or display only options.

As far as firmware idea's

A built in high speed very low duty cycle chirper mode for tuning up might be simple to program in and it would offer a handy way to conserve battery while tuning ..vs a 2+ watt dead key.

Bill- I believe what Steve was refering to was the operating frequency readout. Up to now, the ATS series of radios 'sounded out' the operating frequency in morse through the headphones. Steve is adding the LED to give visual readout of the operating frequency (and now battery voltage). It looks like the user may have the option of Morse readout only, LED readout only, or both together. There are no plans for a CW decoder, or LEDs 'flashing in time' with the received CW signal.

Here are some more thoughts on how this could be spliced into the menu.

tapping the DASH paddle toggles the transmitter on in dead key mode.
tapping the DOT paddle toggles the transmitter on in chirper mode (75WPM @ 13% weight).
retapping either paddle (or any button) toggles the transmitter off.

I got the impression that $190 was a guesstimate, not a firm price. Unless Steven has all the components on hand I don't think he can state a definite price. Component prices continue to rise. As soon as Steven says he's ready to accept orders, I'll send in my check. Seems like that may be a month or more away.

You are right, but QRP kit designers have been known to supply kits based on relative personal circumstances, to Radio Amateur's who qualify under Amateur Radio circumstances it is the fun of Amateur radio. Steve has changes his pricing once or twice.

You sell your car to buy ATS3B, I will ask for a credit card to buy it.

And I hope at least I can learn from the schematic to propel an ATS3c, ATS3d and so on.

1303. NO NOT ORDER ATS3B's YET!

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-07-05 20:24:57 UTC
From: Steven Weber
Topic: 1297 Message: 1303

Gang,

Please don't order any of these yet! I have enough to do already and keeping track of pre-orders, keeping want lists, etc, just slows down the work that has to be done first. And there's still pleanty of that to do. Maybe I'll have everything ready sometime in August, but I have a lot of distractions during the summer, so Sept is still more likely. Keeping track of Paypal is a real pain for me and I'd really rather you not use that method unless there is no other choice, like your a DX station.

Thanks for your understanding.

72,
Steve, KD1JV

I had a private email with Steve about preorders 6
months ago. He prefers not to do that because it
takes work to keep track of them. I suspect with the
popularity of the Sprint series, he'll try to make
enough to satisfy the supply. I'd be curious if he
has noticed increasing popularity with each production
run. I noticed with the 3A there were still some
"stragglers" that wanted to buy but it was out of
production at that time they found out about the rig.

Sorry,

That should be "satisfy the demand" not supply.
Missed that error before I hit the send button.

1307. Obsolete ATS Disposition

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-07-06 15:01:55 UTC
From: Mark Brueggemann
Topic: 1297 Message: 1307

Was just thinking, since Steve doesn't sell a particular version
more than one production run, how 'bout releasing the design files
for old versions? The version 3 and 3a ATS's were very popular for
what they were, and maybe some individual or group could take on
the project of sourcing boards and parts for additional runs of
these versions. It's up to Steve if he'd be willing to give his
PWB design files away, but it'd be one way to satisfy some of the
demand that always seems to exceed the supply. That way Steve
is free to work on current/future design, production and kitting.

I believe some of Steve's kit designs are being sold by Doug Hendricks and have often wondered why the ATS series aren't among them, given the unanimous reviews of these rigs among those who own them. In the meantime, I'm eagerly awaiting the release of the ATS3B.

Steve answered this a whille back saying he wanted to keep it a hobby and not turn it into a biesness. it is hard to believe he is covering the price of the parts for what little he charges for his kits. i think he could turn a profit with his kits if he wanted to. his ability to use non convintinal conponents for radios is fasinating.

Look at it this way - Steve is continuing to improve
the ATS series with each release. It is possible that
he will transfer it over to Doug or someone else for
regular kitting at some point. I would suspect that he
might do this when he gets to the point where 1) he
feels that the design can't be reasonably improved
upon, or 2) when he gets tired of screwing with the
design entirely and wants to do something else. I'm
also quite impressed with Steve's designs, and am
counting my pennies so that I have the $$$ for the 3B
when it comes out. Now if we could get a 20-10m 10-20w
SSB rig out of him before the next sunspot cycle
peaks.............

Yes! And thank goodness they do! Let's hear it for some originality in a fist! Likewise, some personality in the fist of a first class Bug operator, is a thing of beauty.

Machine generated CW is nice, but sterile. It's great to hear the character of a well practiced straight key or bug op.

Hard to pump a straight key at 20+ though...at least for me!

One problem with using the straight key on the ATS3 is that you end up forfeiting menu command capabilities plus (on *my* ATS3), the side tone sounds unbearably ringy (unless I use the built in keyer).

On the other hand, using the built in keyer on the ATS3 at slow speeds with an iambic paddle is not easy (at least for me). The problem goes away once I dial the speed up to about 22 WPM but at 18 WPM and less I make a lot of sending goofs (using either of the two modes). I suspect this is just the result of some lazy habit I picked up over the years using a different keyer.

I am on a quest to find an ultra light & reliable iambic paddle that is rugged enough to survive inside my backpack.

I love my Palm Radio Mini Paddles but they weigh as much as my ATS3 does. Three ounces for a paddle was negligible when packing with my Sierra or my unbearable-to-carry K2 but those days are over. I am now enjoying the many benefits of ultra light backpacking and try to keep my "base weight" down to around ten pounds even with a complete ham radio station. "Base weight" is defined as everything minus consumables (such as food, water & cooking fuel)

I have queued a project to install a surface mount version of the touch paddle circuit "P3SMD" inside my ATS3 and hope to homebrew a touch paddle right on the Altoids tin using a tiny section of a closed foam sleeping pad. It will be an interesting project once I get to it.

The great thing about straight key operation is that each operator shows their personal "style" much moreso than with paddles. Don't get me wrong, I can't operate a straight key any better than I can fly to the moon, but it is neat QSOing with a SK operator with a good fist.

I didn't switch to paddles until I was close to age 50, about 8 or 9 years ago. I worked DX, contests, and Field Day, plus many rag chews, with an old brass key from the '30's. I can go close to 20 WPM and still sound OK (with enough caffeine) - but 17 WPM is much more comfortable. I do get tired of it after a while.

I believe that in the old days there were lots of good SK ops who could go much faster than this, and they did regularly. It's a matter of practice. Good musicians are much faster with their fingers, but they practice to get that way.

A couple of pointers if you want to master your straight key:
0) Use a quality key. Many that are for sale will limit you. The J38 style is OK. Many of the fancy keys are not very fast.
1) Mount the key firmly to the table with screws. It should feel solid as a rock for best results.
2) Set the contact gap real close - the thickness of a sheet of paper or less. Clean the contacts once in a while.
3) Set the spring tension light, but play with it to get the best action. It must resonate with your wrist.
4) The key lever and knob should not be too massive.
5) Rest your arm on the table and let your wrist float and flex. If you get it right you'll find that the dits sort of resonate out of your wrist.
6) Your style will change as you speed up. You may have to re-adjust your key and change your position as your skill rises.

Sending at high speeds with a straight key may produce repetive motion injury or carpal tunnel problems in some people. In the old days they called it "glass arm". If there were still lots of paid telegraphers with straight keys, we would have lots of workman's compensation cases and lawsuits today. Nevertheless, an hour ragchewing with a straight key can be a lot of fun, particularly if you have a good sidetone or monitoring ability for the necessary feedback. If it screws up your arm or wrist and it hurts, use paddles.

One of the nicest experiences in our hobby is when you ragchew with another SK operator and have a great QSO. It's a fine art. It certainly is very personal and expressive when done right. You can put a little weight and emphasis into your sending without causing any difficulty.

If you like ragchewing, using a straight key can add some fun!

Or, you can send with a definite Lake Erie Swing likes of which I've
been accused.

I've sent with J-38's, Rat Shack Specials, Some sort of Navy Key, and a
couple pieces of wire, and have been able to make good enough code for
most any half way competent operator understand me. I passed the 20 WPM
sending test before the FCC in the Denver office with a J-38. I don't
like sending at 20 WPM with a straight key, and I don't know if I could
do it now, since I'm out of practice, but it's doable.

I also use a bug - and will use a bug again when I find it from my
recent move. It's a Vibroplex Blue Racer, probably 50 years olde, and
except for several replacement jewels, I've never needed any servicing
of it.

I've never been able to get the hang of an electronic key. I either use
a couple pieces of wire or my computer to send code now that I've
misplaced my bug and by J-38 during a recent move.

I've also heard many folks who couldn't even send their own call without
errors with whatever electronic gadget they were trying to use. In my
book, the only valid reason for that is the aftermath of a stroke or
other debilitating physical disease which affects muscle coordination.

If you have some scrap PC board you can make one for virtually nothing.
http://www.geocities.com/n2uhc/paddle.html

I have excellent results with it (I built 4 or 5).
Elevate the the paddle by mounting on a 1" piece of wood AND
make he paddle-lever longer so it sticks out
Matches portable QRP very well.

Herman N0JN/du7 near Cebu.

Hi Chris
Re your request about keys. I use an ex WD (War Dept) key I picked up as a boy (I'm now 56. It is marked KEY W.T 8 AMP No 2 MK III). Like you my CW is rather slow and although I have a paddle keyer I always manage to send too many dots, so revert to the ex WD.
For QRP transmitters which are, for portable purposes, usually small it seems a little bizzare to use a key the same size as the rig. I have recently tried using a microswitch which measures about 2cm x 2cm x 1cm. I use this in one of two ways:
- for cold weather when out on the hills I use my thumb on the switch and this has the advantage that I can keep my hand in a warm pocket!
- When its warmer I hold the microswitch in my hand, as if I were holding the knob on the key, and tap the contact (which has a nylon roller on the end) on the microswitch agains by arm, knee or anything else!

This is not a perfect solution, but I can send reasonably accurate code at 12-15wpm.

There are lots of good ideas for HB small keys on the Net.

Best wishes

Jim G3ZPD

The ATS-3B prototype got a good work out this weekend at Lobstercon. It got out to the west coast and into Europe on 40M, no problem. Of course, the "88" up about 50 feet and being near the ocean helped :-)

The general consensous was the LED read out for frequency is a worth while addition. I've also decided to add a current sense chip to the PA supply. It will rest the MPU if the current exceeds about 800 ma. This should be low enough to protect the 2N7000's and keying fet if things get out of hand, but is high enough to support 5 watts out, with some margin.

I've got more parts on order today and hopefully will be ordering boards soon. I'll see about uploading some pictures of the board to the gallery later tonight.

Steve,

The current protection would be a nice improvement. This might be faster and better than the polyswitch (PTC) I put in my ATS-3A.

Just for curiosity, what kind of tuner and feedline do you use with that "88" at 50 feet?

Thanks,
KX0R

The 88ft doublet we used at Lobstercon was fed with 450 ohm windowed ladder line. I don't recall what we used for a tuner. Most likely a small z-match.

Yes, it should react pretty quickly. Hopefully quickly enough if its needed.

>Just for curiosity, what kind of tuner and feedline do you use with
>that "88" at 50 feet?

The feed line was standard 450 ohm window line and the tuner was a homebrew
Z tuner AA1MY built.

Hi Folks,

Like many, I'm anxiously awaiting the release of the -3B. I'm also completely inexperienced at portable ops. I'd like to hear what you are using for your complete portable station - from power supply/batteries to antennas/feed lines and everything in between. That will help me get a feel for the "other stuff" I'm going to need.

Tnx es 72 de Tim KX3H

To add,

I wonder if 12V ops would be reasonably safe with
the availability of small lead, Nimh and 11.1V Li
batteries with the new protection circuits planned.

My PORTABLE station includes a commercial vertical on 20M with 3 ground radials and 40' of RG8X. I think it is the Hy-Gain single-band vertical. It is pretuned for the lowest SWR on 14.060 MHz. I usually don't do other bands when portable, but have a dipole for 40M if needed. The telescoping sections on the vertical are marked so that no additional tuning is required upon arrival at any remote site. The ATS-3a is completely self contained with internal batteries, etc. See the photos in the Photos section for W5ACM for my ATS-3 and ATS-3a. The batteries in the ATS-3a are two 200 maH LiPo - good for about two hours. I have two 650 maH LiPo in my ATS-3 - good for over 6 hours. Power output is about 3 Watts with the 7.4 - 8 VDC from the LiPo batteries (http://www.batteriesamerica.com <http://www.batteriesamerica.com/>).

ATS3
Elecraft T1 Tuner
8' RG-316 jumper with pigtails (T1 to ant)
2' RG-316 jumper (XCVR to T1)
26ga silver teflon wire, 24, 36 and 48 ft pieces.
6ea AA cell holder
Palm Key paddle
Earbuds

Fits in a small zippered shaving case.

Have taken this on several airline trips in carry-on luggage,
no problems with security. An appropriate length of antenna wire
is chosen for the proposed installation, and tossed/tied/strung
in place as a vertical, doublet, inverted L, V, etc. Turn on the
T1, hit the key, wait for the green light and I'm off and running.

A 6AA pack was chosen due to the ubiquitous nature of AA cell
availability pretty much anywhere in the world, so I don't
mess with rechargeables. Alkalines provide a decent run time,
and the ATS puts out about 2W at that input voltage with little
risk of damaging finals due to SWR (until the tuner tunes).
In a pinch I can disconnect the AA pack which has a 9V battery
style connection and use the 9V battery out of the T1 (once it
has tuned) and get a couple hours' operating out of that.

Actually there is a new player in town that changes the Lithium battery game.

Lithium Iron Nano Phosphate (LiFePO4)

They have a slightly lower voltage, so 4 cells in series produce voltages up to 14.4 and avoids the overvoltage problems of Lithium Ion/Polymer. The current cells are 2.3AH.

These batteries don't catch fire and deliver more current than other Lithiums. Eric WD6CMU put together a 4S5P pack (4 serial 5 parallel = 20 cells) that is rated at 14.4V 10AH 3 pounds and delivers 200 Amps. It will start your car. They can be charged from empty to 90% in FIVE minutes.

I have started a web page with info and links on these batteries at:

http://www.hsfdg.org/wiki/LithiumIronBatteries

I posted a couple of pictures of my original ATS station set up, under album "W2AGN Kitchensink" For power I use either a ten-pack of 2500Mh Nicads, or a small 4AH SLA (which lasts for a LONG time!). I have become a believer in the end fed 1/2 wave, cut for 40M. It works super on 20M also. Simple antenna, winds up on a little spool. Actually the whole station could be carried in the pockets of one of those "sportsman's vests."

I have only begun to assemble the components for my future ATS-3B station. So far all I have completed is the BLT antenna tuner. I will be working on an N0SS CW Zero-Beat Indicator this weekend (actually two of them, one for my older big rig). I also plan to get another NEQRP SCAF Audio Filter soon. The plan is to combine the ATS-3B, SCAF and Zero-Beat Indicator in one package.

I think what your doing is overkill. The ATS3 I have has a very
narrow receiver! To call a person on the right frequency is set by the
tone YOU set in setting up the radio. If you stay and tune stations to
that tone you will be on their frequency. Not a problem.

Date: 2007-07-13 22:54:54 UTC
From: mstangelo@comcast.net
Topic: 1331 Message: 1341

Tim,

For portable operation I use the Emtech ZM-2 Z match:

<http://emtech.steadynet.com/zm2.shtml>

It's small, tunes parallel transmisssion line fed antennas as well as coaxial fed or wire antennas, and
most impotrantly, has a built-in SWR reflected power bridge using an LED for indication of your match condition. This is a resistive bridge, so the worst SWR the ATS will see while matching is 2:1. This helps in protecting your final transistors.

73,

Mike N2MS

To: AT_Sprint@yahoogroups.com
Subject: [AT_Sprint] Describe your ATS station?

Hi Folks,

Like many, I'm anxiously awaiting the release of the -3B. I'm also
completely inexperienced at portable ops. I'd like to hear what you
are using for your complete portable station - from power
supply/batteries to antennas/feed lines and everything in between.
That will help me get a feel for the "other stuff" I'm going to need.

Jim,

You're going to find the N0SS zero beat indicator very handy. I installed
one in my K2, and it's a wonderful addition. I'm fairly tone deaf, and it
really helps my return call rate, since my "wet filters" can't be depended on !

It's a small board and should fit anywhere. Regarding the SCAF, one can
never have too many filter options! :-)

Go for it!

Tim,

True portable operating is an activity that will evolve and change as you give it a chance. You try things and see what works and what doesn't. What works in a campground may not be so cool if you hike or backpack with your rig.

For campground camping at local Scout events, which are mostly winter campouts here, I take a QRP rig, a tuner (BLT or other), cables, earbud headphones, Palm paddles, small storage battery (lead, NiMH, or LiIon), a dipole cut to 70 feet, 50 feet of 300 ohm line, dacron lines, and a fishing pole with a cheap Zebco reel to put up the lines for the antenna. For trail use I take most of the same stuff, but a simpler antenna, often just end-fed with a counterpoise wire on the ground. This is a bunch of cut hookup wire on a spool.

I think it's important to understand that QRP portable is a real challenge to do well, and that it takes a lot of experimenting to figure out what works OK. You should plan on plenty of imperfect outings before you'll feel like things are going OK. Running CW in the field is about ten times harder than operating your home station.

Cold weather, snow, rain, insects, and wind can make setting up a station and operating very difficult. Lightning can kill you if you put an antenna up at the wrong time. Even a dipole can catch enough high voltage to jump through the soles of your shoes. Operating inside a tent can be very uncomfortable after a while. In really cold weather, you may have to wear gloves just to hold the paddles, plus a hat over your phones, and a headlamp as well. Ballpoint pens don't write when it's cold, and logging can be impossible without a pencil. Every antenna/feedline/tuner/rig/band combination should be tested before taking it out in the field, or you may find yourself off the air because you can't get a good match on the band you want to use.

The upside is that portable contacts can turn into great QSO's, and the experience is very magical. Your hard work and frustration will pay off, and you'll have amazing experiences in unusual settings.

The ATS3 series of rigs solve many of the problems of portable operation, because the designs reduce weight, size, power drain, and complexity. You still need an efficient antenna, and there are few really good instant answers.

There are plenty of experienced portable operators, so listen to what they write and say. I know I have a lot to learn about this part of our hobby.

This Sunday evening the Flying Pigs Amateur Radio Club International will be holding its monthly Run For The Bacon. This is a friendly, two hour QRP CW Sprint, which is open to ALL radio amateurs, will last from 9:00 - 11:00PM EDT (0100-0300 UTC Monday).

You may work stations once per band on 160, 80, 40, 20, 15 or 10 Meters. Suggested starting frequencies are 1.812, 3.562, 7.044, 14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs membership number. If you're not a member of the Flying Pigs, and would like to be; then please click on the "membership" hyperlink on .http://www.gentzow.com/fpqrp/ Otherwise, non-members can just use their output power figure.

You can report your score via the Autolog page which can be found at :
http://gentzow.com/fpqrp/autolog.asp
or you can mail your logs to the address given on the Autolog page. The deadline for logs is July 22nd at 2400 UTC.

Hope to catch you on the air Sunday evening!

Topic: 1331 Message: 1345

Like others I use more than one station and/or combination of gear to operate

QRP away from the house.

Over the years I have learned to try to use the same antennas that others brag

about for their particular use and find that some are good and some do not work

as well for me in some areas.

I operate from the beach areas on coastal NC and when I do I have found several

antennas can work and some just don't work. Since there is a lack of trees you have

to use pvc pipe supports in the sand, or sand spikes as they call them, when you set

up a vertical or two or more masts to hang an antenna. You can use dipoles or windoms

at the beach. The only problem is setting them up. It takes several people usually to

pull them out and set the guys for the end poles. Then you have to use longer spikes

to hold the ropes in place.

Verticals work better at the beach because of the ground plane and the salt water. But

you have to raise the bottom of the mast above the ground a few feet and let the radials

droop away from the antenna and spread them out. I have used as many as 64 radials

for an antenna and that was just overkill. I tried it though and the matching on the meter

was near perfect and according to the formula it came down to specs. I tried it and will

not do it again for the length of time it took to put it all out and get it set up. Not for a

quick operation that is. It is a cumbersome antenna to set up anyway. But an awesome

performer. We were there for a week and it was a great performer for the operation.

The minimum of 4 to 8 with 1 or 2 in each quadrant was sufficient to work well. Guying the

vertical is important and we were using 40 meter and 80 meter verticals (homebrew) and we

co-phased two 80 meter verticals for a better signal. Again, a lot of work to put up and you

have to measure out your sections and get the length right before you get in the sand. SAND is a killer

when you put together aluminum sections on the beach too. So be careful it will cause

some of the sections to seize up and they are hard to get apart. With the verticals at the

beach we were only using 180 mW the whole time too and trying to use hand ground

crystals with the Knightsmite to make a long distance contact. That was the main reason

for the large antenna system.

When you have wind you can use kites for supports for the wires and keep them very high.

Here you have to worry about static discharges and storms coming though. We kept some

up almost all night until the winds stopped in the middle of the night, which usually happens

when you are hot and heavy into contacts. Then you have to drag and kite and the antenna

Out of the surf. Not much fun.

Putting up beams is a plus but you need supports for the mast and that requires something

already deep in the sand. If you stay at a cottage you can find something usually. Small

masts and not much height but they work well.

Where we are in the central part of NC and into the mountains we are fortunate in that we

have pine trees and they group up to and over 100 feet so we just put a lot of wire in the

air.

When we go portable with a small bag, I will usually take the ATS3, a battery pack, either

9V batteries and the adapter, or AA batteries and the case I made for it. That gives me

close to 12V for a while. Batteries weigh a lot when you carry a bunch, so don't forget that.

If you are trying antennas I have several and use all of them in different locations.

Norcal doublet with an expandable 33 foot DK9SQ mast, and use it for 80, 40 and the other

bands well in most conditions.

A W3EDP roll out is another good performer and you just shoot it up in a tree and hook it up

to the tuner and lay out the ground wire. It does very well for short sprints.

I have been trying and getting a good NVIS antenna system set up for quick use. It is good

for 1000 miles or less and worked well for FD this year and we are working on it with different

specs in the club and we have found it performs very well on 80 40 and the other bands.

It is long, though, and needs a lot of space in four directions. It is very lightweight and we can

set it up in less that 20 minutes. Very functional for emergencies and a great performer.

Loops work well in both horizontal and vertical configurations. Height and space are a big

need for those, and we have several of these made up to use in different locations. They perform

very well and we have cut and added many times to get them right with 450 ohm ladder line.

They work and perform very well but are cumbersome to carry much of a distance. We use them

mostly for places where we just call drive up's. That is where we use the big ones.

Caroline Windoms (OCF) antennas are good performers but are weighty and cumbersome and only

for drive up locations.

Tuners include the ZM2, the LDG Z11, and the Rainbow Tuner. All three have their applications and

work well. I prefer the ZM2 by Emtech because you do not need power for it. For backpacking and

places where you do not want much weight it fits well in a small backpack.

The LDG Z-11 is an awesome performer and works well in auto or manual mode and tunes almost anything

I have put up from one end to the other in the bands. It also has a memory so that when you switch bands

it will remember the last time you tuned the antenna and quickly tune to that spot.

As for operating, I have my favorite combinations and keep them in a steno notepad and from my experiences

and different sprints and the like, I pick my combinations and keep them together in a jump bag for a quick

jaunt to the woods. You will have your own preferences after a while and your best combination of antenna/radio

groupings for different areas. You just have to try them all out and see what works best for you.

As for the earphones, I have noise cancelling padded phones down to earbuds. I have reconstructed earbuds with

Newer pads and used different foam types and found the best combinations there too. Depending on where

You are operating and how you operate.

As for logging I have a laptop and if I am doing a long contest I will use it with a logging program. If a short event

I have several log books and one is better than another. It is water resistant and you can use a special pen with it

too and it will not run the ink in the rain. Logging is important and you also need some sort of leg pad or holder.

I have one that I got in a military surplus store for pilots that has a light on it. It is aluminum and does not weigh

much at all. I also made a homebrew holder for the paddles to sit on one thigh while operating in a tent. A small

clip board is optional and comes in handy with homemade log sheets. Pencils write in the rain and waterproof pens

write in the rain, but operating in the rain is not a nice place to be anyway. Snow and rain usually happen a lot

so that is another thing to think about. A good poncho is a must for backpacking and keeping dry on the walk in

or out of a location.

If you go to a park or some other location a tarp is a must to keep the sun off you and the rain off if you stay

for a length of time. Then you need some small rope to tie it up. I carry a roll or two with lines already cut to

tie it up to a couple trees if they are around or I carry a bag of rods I got at the wal mart. Two make up a 6 foot pole

and 3 make up a 9 foot pole. They are also good to raise up the end of the Norcal doublet or the NVIS antenna

ends. They do not interfere with the antennas either.

As for the power supplies, I have several 12V gel cells and chargers for those. Depending on where I am

going to set up I can take one or more of those to use for power too.

A headlamp and a small lantern light are a must for evening hours and walking in and out of a location in the dark.

I have a headlamp that has red and white LED's and a regular light bulb. It uses 3AAA batteries and lasts a long

time on the LED lights and shorter on the regular bulb. I also have another LED (4 AA) that I carry in my pocket

for hanging in the tent in the middle for plenty of light. It has 7 LED bulbs and is very bright when it gets dark.

For operating on a table I use a small Exponent gas lantern that uses the same gas I use for my exponent gas

stove. I carry the stove with me for my coffee. I can carry water to make coffee or just use it for crystal light

powders to make up a drink too. As for the drinking, I use a camelback and mine holds 200 ounces. So it is

plenty of water to drink or to spray on my head when I get hot.

As for operating from a tent I found a nice light fold up seat that can double for a pillow. It fits nicely on the

back of my backpack and when I sit I have support for my back when operating. It is also good on a park

bench or picnic table. They are available at most of the camping supply outlets.

Hat, now that is a must along with a walking stick. Hat is one of several. The wife usually gives me a new

one every couple years and the newest one has mesh on the sides of the top and is very wide brimmed. It

keeps the sun off the neck and whatever falls from the trees off my neck as well. Mainly it keeps the sun

off the bald spot on the back of my head too. Hi hi

As for paddles (since I only operate CW) I have many there. I have several homebrews and a few I purchased.

My favorites are the palm paddles and the whiterook. Palm paddles can sit well on the leg rest and make

operating very comfortable.

Another plus is a light weight shirt, "Columbia" is the one I use, which has pockets galore and I can keep

odds and ends in the pockets. Matches, snacks, pencils, pens, etc. Also if you hike much you have to

learn about socks and boots. Learn before you go hiking though. Don't break in a pair on a hike. Bad

mistake there. Socks, pay for the better ones, and carry an extra pair so you can put on dry one's. Zip locks

are a must too to keep things dry, like underwear and socks. And paper and matches.

If you go hiking and camp too, Tents are plentiful and you need to find one that is lightweight and suits

your needs.

And don't forget the small shovel or the spade to dig the hole with and the paper for the hole. And use

the biodegradable type. I recommend you read a good book there, "How to Shit in the Woods" by a very nice lady'

Katheen Meyer, who did a lot of research on the subject. That is a must to save our environment if you hike much.

You will enjoy the stories too. It makes good reading when there is not much on the radio too. It even has

a chapter for the lady hikers. I recommend this highly.

As for carrying cases for the equipment alone, I have pelican cases for trips, that I can put a whole rig with

the antenna and batteries in. They are good for travel and go through customs well at the airport. As for

light travel I have several sandwich type zip up bags that keep the water out and the snow out. I like those

for their functionality. Again, zip lock bags are a must with gear when you expect bad weather.

As for the antennas, you have to pick the one you like and make up new ones. Try new wire sizes, and weights

and put them on an analyzer and see what you have. I have cut a lot of wire and ended up not using them

because they did not perform well. Usually though, if you put enough thought into what you are making,

Even zip cord, cut the the right lengths and strung up on my 33 foot mast at the right angles, as a norcal

doublet, works very well.

Oh, an a real must is a journal. Keep a journal of your events and what you used. Also remember the

propagation at the time. Some antennas do not work at all when the propagation is bad. But then again

the best one's do not work well then either. So next time you go it might be one of the best one's you

have in your arsenal.

Above all else, take someone with you. Take a non ham when you can and show him how much fun

It can be. The hiking alone can be the most fun you have on the trip. Whether in the mountains, or

on the beach. You might get lucky and see some logger head turtles on the beach laying eggs, or

you might meet someone on a long hike with some stories to share. You just never know what you

will learn from someone out there who has been doing it for a while.

As a side note, the ATS3 is very small, compact, and fits in a shirt pocket as well. I can put my

antenna, radio and paddles in my shirt pockets with some rope and a sinker and go to the woods

and operate. A small notepad for logging with a good mechanical pencil and you are set.

So, go have fun. Take notes and one day you will find the right combination that suits your and

your needs.

I hope this helps you some. If I can help further, let me know and I will see what I can relay to you.

1347. July NAQCC Sprint & giveaway

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-07-17 01:48:34 UTC
From: Larry Makoski
Topic: 1347 Message: 1347

This Wednesday evening, the North American QRP CW Club will be holding its monthly sprint.

Here are the particulars:

Date and time:
Thursday, July 19th, 0030-0230 UTC
(Remember that's Wednesday evening here in the USA) That's 8:30 - 10:30 EDT, 7:30 - 9:30 CDT, 6:30 - 8:30 MDT and 5:30 - 7:30 PDT.

Bands - Frequencies:
80M - 3555-3565 kHz (Be courteous to FISTS operating on 3558 kHz)
40M - 7039-7050 kHz (Avoid W1AW on 7047.5 kHz).
20M - 14059-14065 kHz. General:
A particular station may be worked once on each band. Operate CW only. All licensed amateurs are invited to participate, but only those operating QRP (5 watts or less) are eligible for awards.

Call: CQ NA

Exchange:
RST - SPC (State Province or Country) - NAQCC Nr.
(non-Members substitute power level for NAQCC Nr., e.g. 5W, 1W, etc. Be sure to add the W.)

QSO Points:
QSO with a Member, 2 points.
QSO with a Non-member, 1 point.

Multipliers:
Each USA state
Each VE province
Each country except W/VE
All multipliers count only once in the contest.

Bonus:
If you use only a straight key for the entire sprint, multiply your score by 2.
If you use only a bug for the entire sprint, multiply your score by 1.5.
If you key with anything other than a straight key or bug, there is no bonus multiplier.

Categories:
SWA - simple wire antennas - for those using a simple wire antenna per NAQCC definition.
GAIN - gain antennas - for those using other than a simple wire antenna.

Special Award:
Our special award this month goes to the one with the highest score working the most different call areas in the USA. It's the state that determines the call area, not the call sign number. For example working a W6 in Florida counts for the 4th call area, not the 6th.

The winner will win a set of CD's features K7QO, Chuck Adams' code course designed to increase code speed. Please see:
http://www.arm-tek.net/%7Eyoel//sprint200707.html for further details.

REMEMBER: You HAVE to be a NAQCC member to be eligible to win the CDs; and there's still plenty of time to join before Wednesday night's sprint. To join the NAQCC, please visit:
http://www.arm-tek.net/~yoel//joinup.html

Entry Deadline:
All entries must be RECEIVED before 2400Z on July 25th 2007. So submit as soon as possible, especially regular mail entries.

For further information, please visit:
http://www.arm-tek.net/~yoel//sprintrules.html

Hey gang;

I have seen Mark B.'s VERY small station setup. Mark's dry explanation (below) does not do it credit as it is really well done. And it gave me some ideas to try out that I have since incorporated.

1349. Sleeping Pad Paddle

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-07-25 00:50:18 UTC
From: Ken Lotts
Topic: 1349 Message: 1349

Hi

I just uploaded some photos of an experimental project I had been working on this weekend..

I had this idea to try out a touch paddle circuit integrated into the ATS3 via a cut up section of sleeping pad foam. This was motivated from an effort to shed weight and retain ruggedness and performance. The radio with integrated paddles weighs less than 3 oz. Paddle performance is excellent and they are very rugged. I cant send worth beans using the ATS3 keyer but that doesn't count ;)

Shown in the photos is another one of my experiments that turned into a 6.5 oz QRP tuner. Way too heavy for being in the same league as the ATS3 but it is small and rugged and has very good performance. It has two plastic 532pf variable capacitors in a T tuner arrangement with approx 16uH. It is easy to use with the built in LED resistive bridge.

I installed the firmware offered by W1MT into my ATS3 and really like it a LOT. The new firmware adds a bunch of pretty cool little features. I really like the 10 Hz tuning rate option plus the scan feature provides a useful way to scoot around (without wearing out the miniature push buttons). I also like the A/B vfo selection capability. I personalized the menu in the firmware so as to eliminate the memory keyer function that I never use.

I added the "ultimate filter mod" and it was very worth while on my older ATS3.. I think I damaged something at some point because my sensitivity has gone down especially on 30 & 20 mtrs. I need to debug that. 40 meters (my main band) still works pretty well

Hi Ken.

That is cool! Gues what. I am currently working on integrating the touch keyer inside my ATS rig too.

> I really like the 10 Hz tuning rate option plus the scan feature provides a
> useful way to scoot around (without wearing out the miniature push buttons).

I thought of connecting the two touch paddles to tune up/down buttons and using the Mike's firmware (or copy it into my version of firmware), that enables up/down buttons to be used as a paddle. This way one would get easy tuning for free.

I bought the QT-117 chips from Farnell. They are cheaper there than from touchkeyer.com. Only difference is that touchkeyer.com uses variant with positive logic output, but the chip from Farnell uses negative logic. Negative output is even better for ATS-3, because I may spare the two 2N7000 FETs.

It is stated in the QT-117 datasheet, that the stray capacity of the electrodes decreases sensitivity. I thought about putting a piece of PCB flat on the upper side of the tin and tap on it. I wonder whether the stray capacitance of the electrode to the tin would be too high for the circuit to work.

Vojtech,

Thanks for the info on the QT-117, yes the touchkeyer circuit was a wee bit pricey for what it was. I can report that the stray capacitance of the electrode wires to the tin is not causing any noticable problems in my experimental touchkeyer setup plus since the paddles are side swipers so they are very natural to use. I have a hard enough time sending code with the ATS3 that I did not want to add another variable into the mix by trying a tapper arrangement. Perhaps there is a parameter or routine in the firmware that I can tweak somewhere to make it behave more like my other keyers.

Hi Ken.

That is cool! Gues what. I am currently working on integrating the touch keyer inside my ATS rig too.

Hi Jim.

Sorry, I made an error. I think the part is qt113.
I will look once more at the chips at home.
qt113 is the fastest of its family, 30ms detection delay.

Hi Mike,
Thanks for the great firmware mods with all the easy to read remarks!

I normally pick Iambic mode B but on the ATS3, both A & B throw my fist for a loop. Very odd in as much that it is the only keyer that I have run into a problem with. I am trying to get through this via practicing into a dummy load. Practice never hurts... Still, I cant help but wonder about kind of tweak would make the difference.

OK, not having owned or used an ATS I was not familiar with the receiver characteristics. I will hold off on the SCAF. But with my ageing ears I think I will stick with adding the zero beat indicator for a visual indication. I might also add a small touch keyer paddle board I recently found so I would not have to lug around a key or my bencher paddle.

Noticed that Steve re-desiged his web site. There is an announcement that the ATS-3B will be available in early September at a cost of $190. I had expected the price to be near the $200 level.

Are you chained to your "QRP KiloWatt"? Have you ever wanted to try milliWatting but were afraid that it might be too hard, or perhaps too frustrating; or just plain futile? This Sunday evening the Flying Pigs Amateur Radio Club International will be holding a special milliWatt Run For The Bacon! This is your chance to see just exactly what less than a Watt can do! This challenging, and perhaps eye opening, two hour QRP CW Sprint, which is open to ALL radio amateurs, will last from 9:00 - 11:00PM EDT (0100-0300 UTC Monday).

It will work EXACTLY like a normal RFTB with one important exception - you MUST run less that 1 Watt of power!

You may work stations once per band on 160, 80, 40, 20, 15 or 10 Meters. Suggested starting frequencies are 1.812, 3.562, 7.044, 14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs membership number. If you're not a member of the Flying Pigs, and would like to be; then please click on the "membership" hyperlink on .http://www.gentzow.com/fpqrp/ Otherwise, non-members can just use their output power figure.

You can report your score via the Autolog page which can be found at : http://gentzow.com/fpqrp/autolog.asp
or you can mail your logs to the address given on the Autolog page. The deadline for logs is August 12th at 2400 UTC.

Hope to catch you on the air Sunday evening - who will be named the "Top Piglet of the Sty"?

1365. touchkeyer for ATS3

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-08-05 18:31:23 UTC
From: Vojtěch Bubník
Topic: 1365 Message: 1365

Hi gang.

I built a touch keyer inside my ATS-3a. The keyer works very well and makes the transceiver even more compact than it was. I uploaded pictures to group photos, see album ok1iak.

I once built capacitive paddles using cmos logic chips. It worked well on breadboard, but after I designed a nice SMD PCB for it, the circuit did not work. I suppose the problem was in slightly different chip properties. After some tinkering I gave up on that kind of design.

Then I found about Quantum Research, namely QT113 chip.
http://www.qprox.com/downloads/datasheets/qt113_105.pdf
I ordered two of them from Farnell, one for dash, one for dot. DIL8 are for £2.18, SOIC8 for £1.84. Digikey has both packages for $3.50. Those chips waited for the project more than a year in my drawer.

The chips are apparently the same that www.cwtouchkeyer.com keyers use. The guy is selling a kit for $20 and he must have hard time scratching labels from every chip he sells. The chips come in two kinds. The -L is negative logic output, -H is positive logic output. The cwtouchkeyer.com chips are positive logic and outputs are inverted by 2N7000 fets. For my ATS-3a I used the negative logic chips, which are easier to get hold of and do not need the FETs.

The schematic I used is very much the same as from the datasheet, page 2, figure 1-1.
http://www.qprox.com/downloads/datasheets/qt113_105.pdf

I used Rseries=100kOhm, Cs=10nF, Vcc 3.3V. I configured the chip to low sensitivity, continuous output, infinite duration by setting Opt1=Vss, Opt2=Vdd, Gain=Vss. I added a separate 3.3V stabilizer on the board although the two chips may be sourced from the stabilizer on the ATS-3 board. I connected QT113 outputs to the microcontroller inputs by serial resistors 5k6. I built the circuit with two QT113 SOIC8 chips and stabilizer on a small piece of prefo board, see the album.

There is one feature of the QT113 chips called HartBeat(tm). With every measuring cycle, the output is set to 3rd state for 0.3ms. Those bursts are smoothed out by the debounce capacitors in ATS3. In the www.cwtouchkeyer.com circuits the bursts are smoothed out by the gate capacity of 2N7000.

It is important to keep elecrode capacitance to the ground at minimum. Putting copper clad pcb piece directly on the Altoids tin does not work, the rate of finger capacitance over idle capacitance is too low. It is possible to make the circuit more sensitive by increasing Cs, decreasing Rseries or reconfiguring the chip, but I rather increased the distance of electrodes from the tin. An old celluloid ruler is a perfect material for this purpose. If the transceiver is built inside a non-metal enclosure, it would be possible to glue the electrodes directly on the enclosure.

I did not connect touch paddle outputs to ATS-3 paddle input. I rather connected them parallel to the up/down switches. I find the tuning much more comfortable now. The electrodes are easy to find without looking, tuning around is smooth. W1MT implemented a feature in his firmware, which enables using ATS buttons as paddle. One toggles between the normal/paddle mode by double clicking the RIT button. I copied this part of code into my digital modes firmware, thanks Mike.

From: Vojtěch Bubník
Topic: 1366 Message: 1366

Hi gang.

I published my digital modes firmware for ATS-3a at http://pocketdigi.sourceforge.net
The release information follows.

73, Vojtech OK1IAK

Digital modes firmware for ATS-3a

The code is derived from Steve's work
atsprint 3A dds
80/40/30/20 CW rig
written by Steven Weber, KD1JV
copywrite 6/6/06 all rights reserved

Extended by Vojtech Bubnik OK1IAK to enable modulation of HAM shortwave modes.

ATS-3a is a tiny DDS controlled transceiver designed by
Steven Weber KD1JV, which fits into Altoids tin.
http://kd1jv.qrpradio.com/

Current firmware supports PSK31, PSK63, RTTY, MFSK16,
Olivia, Contestia and RTTYM modes, if used together with
pocketdigi software. There are binaries of PocketDigi for
desktop Windows, Pocket PC and Handheld PC devices. No
hardware modification of ATS-3a is necessary, but an
external interface is needed. For details see the technical
description links.

The microcontroller in ATS-3a is quite full already. To fit
digital modes modulator into 4k of flash rom, I had to
disable following features of the original code:

- Calibration. It is needed only once in the lifetime of
the TRX.
- Direct Frequency Input. Nice feature, but needed too much
flash space.
- Wideband reception is not hardware implemented in ATS-3a.
- Tuning mode
- Iambic B mode.

Additionally, I added keying by buttons from Mike Harnage
W1MT's firmware. The feature is enabled/disabled by double
tapping RIT button. Up/Down buttons change to Dit/Dah.

Technical description:
http://www.kufr.cz/~ok1iak/temp/PSK-with%20ATS3A-success-on-the-air.html
http://www.kufr.cz/~ok1iak/temp/bpsk31-ats3-proof-of-concept.htm

Hi Ken.

I wonder whether your keying troubles are touch paddle specific or general to ATS3. If you are having troubles with touch paddles, it may be caused by the HeartBeat feature of the QT113 chips. Look at the datasheet, page 5.
http://www.qprox.com/downloads/datasheets/qt113_105.pdf

You may test it quite easily. Reconnect one paddle to the tuning switch. If that paddle tunes faster than the switch, you are experiencing HartBeat bursts. If this is true, than I would recommend either to increase debouncing capacitors in ATS3, or adding 100pF capacitor between source and gate of 2N7000's on the touch paddle board.

I connected QT113 output to the MSP microcontroller input by a 5k6 resistor and a shottky diode. I wanted, that no current flows, if the touch paddle is open, but the microswitch is closed. It worked, but the low level of the touch keyer was raised by 0.2V of the shottky diode and debouncing caps of ATS3 were not effective to filter the HeartBeat strobes. I experienced "very fast tuning". After I removed the diodes, it works now.

FB Vojtech,

I was going to ask you for a copy of your work. I bought a hp iPQA hx 2495 last week and installed your pocketdigi program. Neat program and seems to work fine.

The 3B uses the processor with 8K memory, so there should be room to put the digimodes in there without losing any other features. And since we now also have the A/D converter available, it should be possable to use that to do the tone modem decoding, so a seperate FSK tone decoder chip won't be needed.

With any luck, I hope to be able to intergrate your digimode firmware into the -3B before they start to ship, so it will be digial ready from the get go. At least I'll try.

> go.

That's the greatest news since I was told I will be father soon. That is another project of me for the near future.

> At least I'll try.

I hope it will not be difficult. I am not using any special feature of the microcontroller. Please do not hesitate to ask. I am certainly willing to throw some more time into the project, if it comes into 3b.

There is one feature I did not have time to implement yet and the MCU was full anyway. I thought of using watchdog to kill digital TX if someting goes wrong. Currently if you unplug the sound card output during TX, transceiver will be keyed down indefinitely.

> And since we now also have the A/D converter available, it should be possable to use that to
> do the tone modem decoding, so a seperate FSK tone decoder chip won't be needed.

It is a great idea to use the A/D converter for the modulation. The thing is that the sound output amplitude is too low to trigger any MCU digital input directly. The audio signal would need some amplification.

Currently the modulation speed is 1200Bd, tones 1200Hz and 2200Hz, which is the BELL202 norm. It is possible to deviate from the norm, if it makes the firmware simpler. For example if one makes the second tone 2400Hz, which is 2x the lower tone, the firmware timing will be simpler. There will be one or two signum changes per bit, which shall be easy to detect. But the modulation will be very similar to Manchester then, only conveying half of the information that Manchester does for the same bandwidth. The double symbol speed of Manchester is currently not needed though.

There is one reason to stay with two tones instead of converting to Manchester. The 1200/2400 FSK modulation shall be oblivious to nonsymetric signal.

I was thinking of throwing away the FSK decoder and replacing it with a simple OpAmp slicer. I was planning to do it this weekend actually. Do you plan to start with the external BELL202 decoder, or will you do it with the A/D from scratch? If you want to start with the external decoder, then it may help you, if I debug the simplified interface this weekend.

I phoned in a big parts order to Mouser today, seeing they seem to have been losing my email orders. Almost everything was in stock, just a couple of things were not complete, but they had enough on hand to get started, and the balance of what is missing have reasonable lead times. Just need to get a few more odds and ends and will be ready for when the boards arrive at the end of the month.

Been working on the instruction/assembly manual. I should have it far enough along in a few days to put a preliminary copy in the files section of the group. That will give you all something to look over and suggest changes to.

microcontroller. Please do not hesitate to ask. I am certainly willing to
throw some more time into the project, if it comes into 3b.
>

I'll let you know if I run into trouble!

>There is one feature I did not have time to implement yet and the MCU was
full anyway. I thought of using watchdog to kill digital TX if someting
goes wrong. Currently if you unplug the sound card output during TX,
transceiver will be keyed down indefinitely.
>

Might be a little hard to tell something went wrong until its too late.
Some kind of Tx time out might be good to include, though hard to tell if
thier just long winded or not.

>> And since we now also have the A/D converter available, it should be
possable to use that to
>> do the tone modem decoding, so a seperate FSK tone decoder chip won't be
needed.
>
>It is a great idea to use the A/D converter for the modulation. The thing
is that the sound output amplitude is too low to trigger any MCU digital
input directly. The audio signal would need some amplification.
>
>Currently the modulation speed is 1200Bd, tones 1200Hz and 2200Hz, which
is the BELL202 norm.

TI has an example program for implementing a two tone modem, not sure if
its 202 compliant or not. I'm hoping to use that with little or no
modification. (Since I don't quite understand what thier doing, I hope its
no modification, hi)

I might build a little tone detector circuit to start out with, we'll see
how the software approch turns out first. I figure on cap coupling to the
resistor divider used for battery voltage measurement to input the tone to
the A/D. Since I've used up all the ports (again!) and the boards are

already on order, that's the simplest way of inputing the tone.

1384. Build problems at TP1 on ATS-3a

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-08-08 22:56:46 UTC
From: ab9io
Topic: 1384 Message: 1384

Hello Group,

Well, I have the board populated and de-fluxed. It powers up with "20M" on a 9v battery. My next test didn't go so good, though. I can't get the requisite 4v from TP1 to GND as indicated in the manual. The voltage from the other side of R19 measures 4.98v to GND. R19 was checked and an ohm test from TP1 to pin 14 on U8 gives me 99.6k so I can be sure that R19 is placed well. I re-soldered the pins of U8 to confirm that they are down. I'm stumped at this point. Anyone have a suggestion?

73,

Tony, AB9IO

Be sure you have the proper 3 volt regulator chip in place. It should
be soldered in right as well. Do a lot of checking with your voltmeter
and ohm meter and make sure all the voltages are about right.

Hi Karl,

Thanks for the reply. For good measure, I touched up the pins of both of the voltage regulators. I get 4.99v and 3.5v respectively. The oscillator and DDS chip seem to be getting 3.5v as well. Like I said, I'm stumped on this one. The pin on the DDS chip that is attached to TP1 goes near ground when power is applied. Therefore, the voltage across R19 reads approx. 4.98v. Strange!?!

Hi Karl & Mike,

Well, I got it! You guys were on the spot on this one. I had flowed the solder a bit high onto the oscillator. Just for good measure, I touched up all parts again and found a resistor loose.

Now, I'm reading 3.93v at TP1. The NOR gate is getting a signal, so the 2n7000 gates are at 0v. Good stuff! The last check is good and I'm ready to install L3.

Thank you both again for your help,

Tony, AB9IO

This is a bit off your topic, but I was wondering how you de-fluxed your ATS-3A board? In the past I did not worry about the flux residue much, but in recent projects I have made some attempts to cleanup the solder flux. I have tried a commercial product, an acetone-based nail polish remover and isopropyl alcohol. All just seem to leave a sticky mess all over the board. Any tips would be appreciated.

Hi Jim,

The flux remover that I used is a product called Techspray Flux Remover G3. I saturated the board good-and-proper by using a sweeping motion from one side of the board to another. You may be able to get something like it at your local electronics store for about $10 to $15 a can. It comes in a spray paint can sized pressurized container and lasts a good long time. I have heard of using isopropyl and denatured alcohols and a toothbrush and the residue! I don't think that not de-fluxing the board will hurt anything, especially if the circuit works!

I will warn you that this is the "good stuff", but it will take some of the markings off of the black electrolytic caps on the board if one sprays it in that direction (I did). My recommendation is to de-flux the board well after soldering the SMDs and then leave that side of the board alone. After soldering the through-hole stuff, simply de-flux the bottom of the board. You should be in good shape!

The best product that I've found is call Flux-Off, but I can't get it here. Good luck!

We use this at work:
http://www.hmcelectronics.com/cgi-bin/scripts/product/5700-0019/
Expensive, but you don't have to use very much and it leaves a very clean board. Also uses CFC's so it's not environmentally friendly (in fact the solvent in it is being phased out). I find that I rarely need to use flux remover and don't have any at home. The can we have at work is several years old.

Something I find very effective is automotive brake cleaner,
$2 a large can on sale. It will attack some types of plastic so
you have to be careful, but it's an excellent flux cutter
and degreaser, and leaves no residue. I use it with all
of my electronics work.

Subject: [AT_Sprint] NO NOT ORDER ATS3B's YET!

Gang,

Please don't order any of these yet! I have enough to do already and keeping track of pre-orders, keeping want lists, etc, just slows down the work that has to be done first. And there's still pleanty of that to do. Maybe I'll have everything ready sometime in August, but I have a lot of distractions during the summer, so Sept is still more likely. Keeping track of Paypal is a real pain for me and I'd really rather you not use that method unless there is no other choice, like your a DX station.

Thanks for your understanding.

Yes, Jim. I find that for most people, the .020 (or smaller) solder is much easier to control the amount applied. It makes for as much neater finished project. This is especially true for SMT work. Since goind to .020 several years ago, I only use my .031 for 'heavy duty applications like cable connectors and the like. ALL pc board work here, thru-hole or SMT is done with .020 or smaller.

Also, for those of you who frequent hamfests- If you don't already have a lifetime supply of smaller guage solder- It would be good to keep your eyes open in the flea market areas for good deals on rolls of solder. As Steve's recent experience with Mouser shows, you -don't- want to have to pay retail prices for it. At one local hamfest a couple of years ago, I was able to buy several rolls of .020 and smaller for cheap.

FB on that Jim!

I actually finished my 3a this afternoon with the winding of the 80m coils. Boy, are my hands sore! ;) Mine actually receives quite well on 20m so far and the frequency announcement is spot-on. I still have the alignment stage to go (and casing), but everything is working out well.

From: kd1jv
Topic: 1406 Message: 1406

Upps. don't hit enter when your still in the subject block!

Those of you who are aslo on qrp-l know that I got a little solar powered battery charger the other day. The device is sold by a reseller (Promotek) on Amazon.com for $19.95 + $3.00 shipping. Mine only cost $11.99 + $6.00 shipping, so I guess they decided to change the pricing when a bunch of qrp-l guys started buying them and they relised they had a hot item on thier hands.

Anyway, if you missed the description on qrp-l, its a little box about the size of an Altiods tin but half the heigth and has a little solar panel on top and a 1100 mahr lithium cell and boost switcher inside. Selectable outputs of 5.8/7.8/9.8 volts.

I bought this to help keep batteries in my new PDA and MP3 player charged on the trail, but it looked like a likely candiate to power a ATS3x rig. And it does, sort of. The switcher causes a high pitched whine in the audio and the output voltage drops to 5 volts when you try to transmit.

I thought getting inside the box to see what was in there might be tricky, but turns out its held together with hot glue. A couple of hours out in the sun on the roof of my car was enough to soften up the hot glue so that it came apart easy enough. There is a pretty big glob of glue between the solar panel and battery, but only a little dab of glue was actually holding one edge of the battery to the bottom of the plastic case.

It uses a MC34063A switcher chip and it was easy enough to find a data sheet for it, as Digi-Key sells the part. A little reverse engineering with the data sheet in hand showed the switcher is set up to regulate up to 100 ma output, not the 400 ma claimed by the instructions which came with the charger.

Changing the 0.5 ohm current sense resistor to 0.3 ohms was enough to boost the current output of the switcher to get just under 1 watt out of the ATS3B prototype. (was 600 mw out with the 0.5 ohm current sense resistor) There's a reverse polatrity diode in series with the chargers DC output and if this is shorted out, power output from the ATS3b is just over 1 watt. This is getting more reasonable. I figure a 0.22 or 0.15 ohm curent sense resistor would be ideal, and get the power output up to more like 1.5 watts. We don't want to push the lithium battery too hard, as the peak currents asked for it to deliver is getting to be on the order of 2.5 amps.

That still leaves the audio whine to content with. An additional filter section on the output of the supply should help that. As is,

there really isn't any room in the box to add one though. However, if the white flashlight and uV money checker LEDs are removed, along with thier on/off switch, there would be room on the circuit board to add the additional filter. Too bad that area of the board is at the opposite end from the DC output jack.

So, with these modification, this little 4 oz solar battery charger just might power the ATS3x nicely out in the field for a few hours, especially if there is sun to help it along.

72, Steve KD1JV

Goes straight into the battery through a diode. Same with the external DC
in jack, so don't try that with a well regulated supply at the 5.8 volts it
says is the input voltage. There is a third wire coming out of the battery
pack. Best I can determine its a 4.7 K resistor (thermistor?), but it is
simply used to turn on a transistor to light the "charging" led.

Hi all, I have a National chip designed to be a Lithium battery
charger. It has a long paper about how it works and it is a bit complex.
So what I do now is be sure to use a charger that is MADE for the
battery. I do not think a solar cell of indefinite size should ever be
put to a Lithium cell through a diode. I have a 75 watt solar panel on
my trailer and it MUST have a regulator to charge a lead acid deep cycle
battery I use.

If the voltage coming out of the solar panel or charger is always
less than the maximum charge voltage specified for the lithium cell
or battery, and the current is limited to less than the maximum
charging current specified, there should be no problem over-charging
the lithium cell or battery.

However, the voltage put out by solar panels varies, even if there is
no load. In particular, the voltage goes up when the silicon is cold.
A typical silicon solar panel starts out high and then drops in
voltage as the silicon gets hot. On a hot day the effect is large
enough to cause a significant reduction in the power output and the
charging rate. Charge controllers are designed to deal with these
variations.

Charging a lithium cell or battery to a higher voltage than specified
may cause permanent damage and/or lead to catastrophic failure.
Please be careful about this.

This is true, but the little solar panel which comes hooked up to this battery is lucky to charge it at all! And only if you can some how manage to have noon day sun for 10 hours.

However, be careful of the external charger jack. With out at least a current limiting resistor in series or a proper lithium charger circuit built into the external supply, that could cause damage! I imagine the optional AC charger which is suppost to go with this gizzmo is pretty much next to impossable to find. Better just stick with the sun.

BTW, I've given up trying to get more current out of the built in switcher. Seems it needs a minimum of 4.5 volts to get 400 ma out of it and stay regulated. Might try some of those new super caps on the output - the ones designed to stiffen up power supplies by supplying peak currents.

1413. NAQCC August Sprint

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-08-14 03:38:57 UTC
From: Larry Makoski
Topic: 1413 Message: 1413

This Tuesday evening, the North American QRP CW Club will be holding its monthly sprint.

Here are the particulars:

Date and time:
Wednesday, August 15th, 0030-0230 UTC
(Remember that's Tuesday evening here in the USA) That's 8:30 - 10:30 EDT, 7:30 - 9:30 CDT, 6:30 - 8:30 MDT and 5:30 - 7:30 PDT.

Bands - Frequencies:
80M - 3555-3565 kHz (Be courteous to FISTS operating on 3558 kHz)
40M - 7039-7050 kHz (Avoid W1AW on 7047.5 kHz).
20M - 14059-14065 kHz. General:
A particular station may be worked once on each band. Operate CW only. All licensed amateurs are invited to participate, but only those operating QRP (5 watts or less) are eligible for awards.

Call: CQ NA

Exchange:
RST - SPC (State Province or Country) - NAQCC Nr.
(non-Members substitute power level for NAQCC Nr., e.g. 5W, 1W, etc. Be sure to add the W.)

QSO Points:
QSO with a Member, 2 points.
QSO with a Non-member, 1 point.

Multipliers:
Each USA state
Each VE province
Each country except W/VE
All multipliers count only once in the contest.

Bonus:
If you use only a straight key for the entire sprint, multiply your score by 2.
If you use only a bug for the entire sprint, multiply your score by 1.5.
If you key with anything other than a straight key or bug, there is no bonus multiplier.

Categories:
SWA - simple wire antennas - for those using a simple wire antenna per NAQCC definition.
GAIN - gain antennas - for those using other than a simple wire antenna.

Special Award:
The purpose of having a special award is to perhaps award a certificate to someone who knows they can't win one of the regular 1st/2nd/TNW certificates, but would still like one of our beautiful NAQCC certificates to display in the shack. Our special award this month goes to the one with the highest score who has in his log a station starting with A,K,N, and W.

The winner will win a set of CD's features K7QO, Chuck Adams' code course designed to increase code speed. Please see: http://www.arm-tek.net/~yoel//sprint200708.html for further details.

REMEMBER: You HAVE to be a NAQCC member to be eligible to win the CDs; and there's still plenty of time to join before Tuesday night's sprint. To join the NAQCC, please visit: http://www.arm-tek.net/~yoel//joinup.html

Entry Deadline:
All entries must be RECEIVED before 2400Z on August 21st 2007. So submit as soon as possible, especially regular mail entries.

For further information, please visit:
http://www.arm-tek.net/~yoel//sprintrules.html

I heard a lot of the Chinese MP3 players, that are charged from USB, have no better charger than a silicon diode and current limiting resistor in series with the single cell. LiPols shall not be charged over 4.2V, common LiPol protection circuits switch off at 4.3V. The cell will last longer, if it is charged to a maximum voltage of 4.1V, which yields only 80% of the capacity.

I once built a simple charger for my old Palm Vx PDA, which did not have an internal charging circuit. I built something like this
http://www.rcgroups.com/forums/attachment.php?attachmentid=99302.
LM317 regulators are not precise and their output voltage vary slightly with temperature,, but setting output voltage to 4.1V shall be safe enough to the cell.

I saw your post on QRP-L Steve, glad you shared.

I have a Solio, that I got as a fathers day present... I immediately looked at it and thought it'd be great for this; however, it seems to "mate" with the device you intend to charge. I haven't fussed with it to see if I can bypass it's intelligence without destroying it, so that I could power my ATS or other QRP gear...

It's significantly more expensive than what you discovered and offers similar utility, though.

The pack inside is standard, and could be replaced with something with higher capacity, which might make it really useful if you're going to be out for multiple (sunny) days. In my own tests it will come to full charge in an average day, but, one has to be careful that it stays in direct sun most of the time. Ultimately I ended up setting it on the front step of my house...

kd1jv de n8xx

Hi Steve:

My ATS (no suffix, but lettuce call it an ATS-I) arrived from a seller today. It seems complete - but I haven't fired it up. I figured I'd get the latest and greatest "straight poop" from the designer before I tried any DC on the device. The documentation which comes with it has a series of Mods which are from correspondence with you dated 6/1/2003 by the original owner.

Are there any newer mods or newer software for the device? Any watchouts? Is there or was there an 80 metre module made for that version of the ATS? I love working 80 metres! 40 is okay, but local yokels like 80 metres.

72/73 de n8xx Hg

Hank,

I'm no Steve but the best info (other than Steve
himself) for the first ATS rig is at Monty's site:

< http://www.io.com/~n5fc/atsprint.htm >

There was no 80M module. The mpu was not the TI that
the later rigs employ so what you get on the chip is
pretty much it.

Enjoy that piece of ATS history!

The ATS-1 uses a 90S2313 atmel chip, which only has 2K of memory, but is reprogrammable. All 2K is used. I suppose it would be possible to make it do 80M if you were willing to loose one of the other bands, but you'd be on your own as to figuring out the new filter values. And you'd have to wait for me to get around to changing the program. At the moment, that could be a long wait!

I did rewrite the firmware some time back, which added DFE mode and made it work as similer to the ATS2/3 as possible. I belive I made it calculate the DDS tuning word on the fly instead of adding/subtracting fixed steps and added the DDS reference calibration mode. I *might* have the documentation for those changes kicking around the hard drive someplace...

I don't know what this is all about. No one from NEQRP has contacted me
about this idea. Whats up guys?

I am working with Vojtech, OK1IAK to add his digi mode firmware to the
ATS3B, but not sure we'll have it all straighten out in time to include
with the first batch of kits to go out, hopefully in a couple more weeks.
Hopefully I can put some time into it this weekend. It will require using
his Digi-mode software for the Pocket PC. Not sure if it will run on a desk
top or lap top? It will also require an interface board, possibly just a
simple op amp.

Currently, there is not enough memory space available in the processor used
with the 2/3 or 3A to support digital modes without loosing a number of the
other functions. The processor would have to be removed and replaced with a
chip with larger memory capacity to keep all the current features.

There are three windows flavors supported: Pocket PC, Handheld PC 2000 and the usual desktop windows since Windows 95.

> It will also require an interface board, possibly just a simple op amp.

I already built the op-amp interface board into the ATS-3a on a piece of prefo board, mostly with SMD parts. As adviced by Steve, I glued it to the processor by a double sided tape. Because I doubled up/down buttons with the touch pads and am able to touch key with it, I reused the key jack socket for sound in/out. One may now connect Pocket PC to the TRX just with a single audio cable. I am happy to get rid of the octopus of the external interface. I will post pictures soon.

That's true. One may decide which features to sacrifice during compile time of the firmware. But I suppose the biggest inconvenience is to send the TRX for programming or buy/build the programmer, learn the programming software and do it yourself. But anyway, I would be happy to help.

This Sunday evening the Flying Pigs Amateur Radio Club International will be holding its monthly Run For The Bacon. This is a friendly, two hour QRP CW Sprint, which is open to ALL radio amateurs, will last from 9:00 - 11:00PM EDT (0100-0300 UTC Monday).

You may work stations once per band on 160, 80, 40, 20, 15 or 10 Meters. Suggested starting frequencies are 1.812, 3.562, 7.044, 14.062, 21.062, and 28.062 MHz.

The exchange is RST, S/P/C (State, Province, Country) and Flying Pigs membership number. If you're not a member of the Flying Pigs, and would like to be; then please click on the "membership" hyperlink on .http://www.gentzow.com/fpqrp/ Otherwise, non-members can just use their output power figure.

You can report your score via the Autolog page which can be found at :
http://gentzow.com/fpqrp/autolog.asp
or you can mail your logs to the address given on the Autolog page. The deadline for logs is August 26th at 2400 UTC.

Hope to catch you on the air Sunday evening!

1426. ATS3a - digital with manchester interface published

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-08-19 20:26:20 UTC
From: Vojtěch Bubník
Topic: 1426 Message: 1426

Hi gang.

My first ATS-3a experiment needed an external BELL202 FSK decoder to read modulation commands generated by computer sound card. The interface was a bit bulky, the FSK chip expensive and not easy to tune. My goal was to build something simple and reproducible into main ATS3 tin.

I experimented with Manchester modulation the last weekend. Now I built the "slicer" data interface into my ATS-3a. You may find the circuit schematic and transceiver picture in the "ok1iak" photo album of this group. The new interface needs updated ATS3 firmware and PocketDigi software. You may get both of them on http://pocketdigi.sourceforge.net

I tried to find a way to add an additional jack socket for computer sound in/out connection, but failed. But now that my ATS-3a is keyed by the touch electrodes glued on the tin, I was able to sacrifice the paddle jack for computer interface. The slicer is built on a piece of prefo board and glued by a double sided tape to the microcontroller. Because PDA's do not usually have input mixer, I mounted a small trimmer with knob above the paddle socket to regulate Pocket PC sound input level.

If someone wants to try it on his ATS3a, he will need to program his transceiver himself. Mike's web page will be helpful: http://w1mt.qrpradio.com/ats3.html
In my latest firmware, one has to reduce the code size by disabling some of the features to fit it all into 4k flash.

Very fine, Vojtech! Thank you for keeping us informed on your project. I assume any dual op-amp that can run from low voltage single sided supply will work OK for the signal splitter.

Also, I am curious. You mention the small trimmer you added to adjust input level to your Pocket PC. Which Pocket PC do you use? Did this unit come with an audio input jack, or did you add one?

I have used your Pocket Digi s/w on a Dell Axim unit, but it has no input jack. I am right now using the microphone in the unit, near the speaker of the radio. I am thinking of hacking into the PDA case to add an audio input jack, and would like to hear if you had to do the same.

From: kd1jv
Topic: 1429 Message: 1429

Spent all day working Vojtech's digi-mode firmware into the 3B code and I'll be - it seems to be working! I'll set up another rig and see if I can talk to myself, then we can be sure. Best I can tell, I only introduced one bug. For some reason, after intial power up, it now takes a couple of seconds before it will respond to the push buttons. Once they start working, everything is normal.

There are a couple of other things I'd like to add to the firmware before its called good to go. One is to see if the A/D converter can be used as a direct input from the sound card. It would be nice to not have to use an interface daughter board. The other thing is to make the code speed go up or down in 5 wpm incerments by clicking the tune up or tune down button when code speed adjust is active. Paddle would be normal 1 wpm incerments. This would be a quick way to adjust your speed to more or less match the other stations speed during contests. After that, I've kinda run out of ideas to what else to make this little box do :-)

Guess I'm still more or less on track to start accepting orders on September 1st. Boards should be just about ready to be sent my way and just need to make one more little order for parts. Okay, enough chit chat, time to go back to work looking for sneakely hidden bugs.

I think so. I used MCP602 from Microchip, which is for $1 at our local "electronics drug store".

> Also, I am curious. You mention the small trimmer you added to adjust
> input level to your Pocket PC. Which Pocket PC do you use? Did this
> unit come with an audio input jack, or did you add one?

I have an old iPaq 3630. The device had bad battery and no mic connector. I got it very cheap.
I placed a 2.5mm SMD jack socket from an old cell phone into the stylus hole and wired internal microphone to it.

http://www.kufr.cz/~ok1iak/temp/iPaq-mic-mod.jpg.png

Here is a picture from Edwin PE1PWF on acoustic coupling:
http://home.wanadoo.nl/e.houwertjes/pics/acoustic.jpg

and his mic hack:
http://home.wanadoo.nl/e.houwertjes/pics/medion1.jpg
http://home.wanadoo.nl/e.houwertjes/pics/medion2.jpg
http://home.wanadoo.nl/e.houwertjes/pics/medion3.jpg
http://home.wanadoo.nl/e.houwertjes/pics/medion4.jpg

You will find some legend from Edwin in the discussion on pocketdigi.sourceforge.net

The setup worked well, but it needed two audio cables. One day, RF burned audio PA and grounds inside the PDA. It happend when I tuned another TX near the PDA/ATS interface setup, when the PDA was connected to the interface by two cables, which made ground loop. The burned audio PA ate battery very short. I was very lucky to find the problem, rewire burned grounds and removed and bridged the burned audio PA. Now the only limitation is high impedance audio output, which is not capable to power ear phones anymore. It works with the ATS interface though.

I removed the added 2.5mm socket recntly and connected internal microphone to the ring of 3.5mm earphone jack. Now the PDA is connected to TRX with just single cable without introducing ground loops. Aditionally, I found that the RX earphone output to PDA mic input needs to be attenuated more than 1:100 and I very much reccomend to place a voltage divider either directly into the PDA, or into the audio cable on the PDA side. If I put the voltage divider into the TRX, microphone picks bursts from the touch keyer. The bursts are spaced every 300Hz, which is the sampling interval of the touch keyer chip, and they are only audible, if I touch the electrodes. With the voltage divider on the PDA side, waterfall is undisturbed.

For those who plan to buy a PDA for PocketDigi, Patrick N0HR compiled a list of devices with microphone input. The list is probably not complete, there are lot of new devices, but it is certainly something to start with.

That's a great news.

> ...
> After that, I've kinda run out of ideas to what else to
> make this little box do :-)

If I may have a little wish.

It is possible to send CW form PocketDigi with the digital firmware. The digital firmware has two transmit modes - PSK and MFSK. CW is sent with the PSK mode, only the phase does not change. Currently if CW is sent by PocketDigi, receiver is muted all the time. I was unable to modify PSK mode to do QSK CW. Namely I was unable to suppress terrible clicks of the sidetone.

If you pull out the interface cable during digital TX, it will continue transmitting. One may set up watchdog to switch transceiver to RX mode if there is no valid modulation command received for say 5 seconds. I will make sure that PocketDigi pads long steady tones and spaces with regular idle commands.

I really like the "buttons as a paddle or straight key" extension from Mike W1MT. I wonder whether

At the end, one feature that I will try to squeeze into my ATS-3a 4k flash yet - fast tuning.
Let's tune up fast. One would press tune up button and hold. By pressing the down button, the "Fast Up" will be activated.
The first "Fast Up" tick will move frequency to the nearest higher kHz and short beep. If you keep the two buttons pressed, it will tune another kHz Up and short beep. On 10kHz transition, it will double beep or beep with different tone. I guess tuning around will be faster than with DFE.

1432. Looking for an Expert on Surface Mount Devices

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-08-22 18:44:33 UTC
From: Hank Greeb
Topic: 1366 Message: 1432

I recently purchased a built ATS (original version, or ATS-I, though this was before there were version numbers). It's dated by KD1JV and copyright 2003. The person from whom I purchased it had it for several years, but never fired it up. He says, and I believe him, that the unit was sent to him as a working unit.

I'm reading N5ESE's mods, and it appears that there at least one mod which don't appear to be on the board. I'm hesitant to fiddle with it, since I have very limited experience with Surface Mount Devices.

I bought the unit because I'm just learning how to work with surface mount parts. I'd like to have something which is working, and which has a chance of working without blowing up a CPU or a final transistor because a mod hasn't been made. I'm on a learning curve toward purchasing an ATS-3b when it becomes available, but want to have something which works in the meantime.

I'd be willing to pay a "reasonable price" to have someone who is expert with surface mount devices take a look at the board and make the mods to minimize inrush current on the finals (I think that's the problem described which uses a 10 ohm resistor), and another which minimizes the probability that the CPU will crash (I think that mod is in place, but I'm not sure). From reading N5ESE's web site it appears that these two mods are the only ones which are critical (though some others might be useful?)

Any takers? Please advise off line.

Hi Hank, you are too hard on yourself. Do this. Get a 9 volt battery wire and put the tiny plug for your radio battery power on it with the plus voltage on the inside pin. Get a 9 volt battery and plug it in to the wire. Now put your head phones on and, then plug in the battery. If you hear nothing unplug the battery. If you hear ats3 20 if you have 20 meter coils plugged in. Or you might hear ats1 since your radio is that old.

This is safe because the 9 volt battery will drop to nothing if there is a short somewhere, or to a low voltage if the current is too high.

I hope you have the manual for your radio. If not I think you can get it from Steve's web page. Follow the set up part of the manual and you will be so surprised how easy it is. Good practise for your ATS-3B

your getting.

Thanks for the pep talk, Ken:

My unit is NOT an ATS-3 nor is it an ATS-3a. I have the "original ATS"
- no suffix - because it was the first in the series. I have
documentation, and a reference to K5ESE's web site with several
recommended mods, including one which is a "must" according to KD1JV.
One problem is that inrush current in one of the RF transistor circuits
can blow one or more transistors. This is one which I don't think is
implemented. It requires cutting a trace on the PCB and putting a 10 ohm
resistor in series with part of a transistor. There's a mod which
changes the source voltage for the CPU, but this appears to have been
done by the person who put the kit together.

I "probably" could cut the trace, and "probably" could solder a 10 ohm
SMD resistor, but I'd be more comfortable if I had a bit more experience
with surface mount devices.

Herb,

The only critical mod for the ATS-1 is a change in the way the DDS chip is powered. there should be a jumper or possibly a RFC between the tops of chip caps on either side of the DDS chip. (U8, about in the center of the board).

The reason for this is the DDS chip has sperate analog and digital supply pins. I incorrectly assumed these pins could have different supply voltages, so the digital side was powered from 3.3 volts and the analog side by 5 volts. This sometimes works, but sometimes causes the DDS chip to lock up, though it does not damage it. The mod disconnects the 5 volts going to the analog supply pin and jumpers it over to the 3.3 volt digital supply. Of course a track has to be cut before this is done. This is a track which is hard to see and connects the right hand side of C22 to the top of the larger cap to the right of the DDS chip.

Chances are good this mod has been made, so you don't have to worry about it. All the other mods aren't really needed and may or maynot make any noticable difference.

The only thing to remember is the ATS-1 is much more likely to be damaged by high SWR than the later versions, though these are not entirely immune. A resistive SWR bridge is definately recommended if you have to put a tuner between the rig and antenna.

Its all there, you just have to use the navigation buttons on the right to get to the kit and homebrew projects pages.

The manual still isn't nearly done yet. I'm reluctant to post a "preliminary" manual, as that often gets people in trouble, then causes me lots of trouble.

1439. ATS-3B goes DIGITAL!

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-08-28 01:43:51 UTC
From: kd1jv
Topic: 1439 Message: 1439

Well, it always was sorta digital, with the uP, DDS and all, but now it will talk digital! (though strickly speaking, CW is a digital mode, just the oldest)

Many thanks to OK1IAK who wrote the digital modulation and sound card communications interface which made it all possible. I would have though it wasn't. Glad I was proven wrong.

It took me awhile to get what Vojtech wrote for the 3A to work in the 3B, but it finally does! I can copy myself sending PSK31, BPSK63, RTTY, MFSK16 and even CW sent from the keyboard of the PDA. It doesn't seem to like sending QPSK31 for some reason, but no one uses that mode anyway, so who cares? There are several other digital modes available, but I don't have the software to receive them. Vojtech says they work. He's also working on adding more modes too. Amazing.

Of course, these modes will only work with the Pocketdigi software. Any other digital mode software doesn't have the unique sound card control communications needed in them. Those programs are ment to be used with generic SSB rigs and we're special.

To top it off, I added a reverse paddle sense for you left handed ops and implemented the "stealth paddle" which enables using the tune up and tune down switches instead of an external paddle. Though using the switches isn't the easiest way to send Morse and will take some practice to get used to, it does work.

Whew, glad thats all done. Maybe I can get to bed a little earlier now. Though there is the manual to finish and parts to be sorted and bagged.

Steve,

Go ahead and get some rest, we don't want you to be kitting while not alert!

Thanks for your part in the work on the digital modes for the ATS-3B. Being a CW and digital mode afficionado this is great news. How warm do the output transistors get with the increased duty cyle when running the likes of PSK, MFSK and RTTY? Is there room to slap heat sinks on those 2N7000s?

I am looking forward to the kit's release. I sold off a couple pieces of excess gear on eBay over the weekend to finance my ATS-3B purchase.

72,
Jim K6JF

Not a day goes by that I don't get an email from someone asking if they can pre-order or pay for an ATS3B. What can I say but no, wait like everyone else. But what to do about the dozen or so checks that I've all ready gotten from people who sent one anyway or didn't ask first? Should I put these on the top of the pile or on the bottom? If your one of those who sent a check already, I know what your answer will be :-) (BTW, I haven't cashed any of these yet - its my policy not to until the kit is shipped)

I've come to a decision. I've been saying that orders will be accepted starting Sept 1st. Thats just a few days away and happens to fall on a Saturday and Labor day weekend to boot. So, we'll let you guys start ordering now. I said I'd let everyone in this group have first shot before updating my web site. This is fair notice.

It will still be 10-14 days before I can actually start sending out the kits. So, what I'll do is take all the orders that arrive by then, put them on the floor and mix them up, sweep them into a pile and work from the top of that. If there are less than 100, no problem. If there are more, those that end up at the bottom will have to wait until I can buy the parts I need to complete another round of 100. Fair enough?

Orders from US stations MUST be paid by check or money order. If you use paypal, I'll refund the money. Sending a check might not be as quick and convenient as paypal, but if you need to use a credit card to buy one of these, you shouldn't be!

DX stations can use paypal. Its the only practical way for them to pay with out a lot of trouble and extra expense. (DX price is $200.00) I'll figure out a way to get these orders into the random mix.

Let the mayham begin!

From: Rob May
Topic: 2156 Message: 1447

I have an interest in trying PSK-31 with the new '3B. I have no experience with Pocket PC's. I don't want to go out and drop a wad of cash on something that I'm buying to play around with. Can anyone recommend some older (cheaper) models of Pocket PCs that would be adequate for running Pocketdigi? I've seen Dell X5's and iPaq 2215's that run at 400 MHz that would be in my price range (~$100). Can anyone comment on these models or sugguest others?

Hello Rob.

I develop PocketDigi on an old iPaq 3630 with Pocket PC 2002 system, 32MB ram and 206MHz CPU.
Generally, anything manufactured in 2002 and later shall work with PocketDigi.

It is possible to couple RX with Pocket PC by placing an ear bud on the internal microphone and it even works quite well, if you are in a quite place. But I would rather recommend to get hold of a device, which has external microphone input. Patrick N0HR compiled a list of devices, which supposedly have it. If the device has no mic input, you may hack it as I did.
http://www.n0hr.com/PocketDigi/PocketDigi_Tigertronics_Interface.htm

It is hard to recommend a particular device. There are a lot of them on the market and it is up to your taste. I would probably pick something newer with internal thumb keyboard. I suppose you may buy some Windows Mobile communicator from your cellular provider quite cheap.

If you are lucky, you may buy Jornada 720 on e-bay for hundred bucks. Jornada 720 is quite old design running Windows CE 3.0, no more manufactured, but it has a decent internal keyboard and 640x240 display. Handheld PCs are discontinued in favor of Windows Mobile devices. I still support Jornada 720, because some HAMs use it.

If you have more questions, please subscribe to hampocket at yahoogroups. Search the archive first and place the questions there.

Thanks Vojtech, this gives me a lot of information to follow. Part of the reason (besides cost) of getting an older one is to be able to add the audio jack and do other hardware hacks. I'm comfortable doing that kind of work. Incredible job you've done on the software.

Well, paypal doesn't have to use a credit card. I hardly ever do, and I use paypal a lot. paypal can also print out all your shipping labels and pay your postage. Using checks is inconvenient, slow, time consuming and awkward - plus they can get lost in the mail.

Sounds like a great kit!

WIth TTY, the '7000's do get a bit toasty after a few minutes running at 12 volts - 4.5 watts out. Not yet alarmingly hot, but close. Long winded rag chews with RTTY probably isn't a good idea.

They run much cooler at a more conservative 2.5 watts out. PSK modes are a little better, as the PA gets turned off between phase changes so the duty cycle is somewhat less than 100%.

I have you mount the '7000's with the flat side flush to the circuit board which acts like a heat sink to some extent. Once the board is mounted in a tin, it should be possible to make a little aluminum "L" bracket to place over the '7000's to transfer some of the heat out to the tin.

I think it is quite possible to flip sides of the finals with the zener diode on ATS-3a. One would mount the FETs flat side up, underlay them with some spacer to be in line with the box, cut a sheet of alluminium of the size of ATS board and sandwich it against the finals.

It would be great for ATS-3c to have two holes across the finals to press the heat sink on them.

Steve,

Thanks for uploading the preliminary ATS-3B Manual. I am a software engineer by trade and I have had to write and review many manuals over the years. I will print out the manual tommorrow and give you my comments (if any). I tend to be a nit-picky perfectionist, I hope you don't mind!

Hey Steve and the gang;

Thanks much for the nice manual preview. As usual it is VERY well done. (I especially liked the 'bookmarks'.)

One thing I noticed during my first read-through;

L4 is labeled as L3 on the schematic.

1463. Super caps + ATS3B

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-04 02:51:48 UTC
From: kd1jv
Topic: 1463 Message: 1463

I bought a couple of those new low esr, 1 farad, 5v super caps (wired in series for 10V)to see if they would stiffen up my solar charger enough to allow it to be used during transmit. Unfortunetly, they didn't help that much.

But I figured what the heck, they should help extend the life of a 9 volt battery for use in the Spartin Sprint. They probably add less than 0.1 oz. Seems I forgot the sprint runs 8 to 10 in the summer and got a bit of a late start, late enough 20 had already shut down and 40 was winding down, so it didn't get much of a test. But I did notice the effective 0.5 farads of having them in series and charged to 9 V would run the rig for a over a minute before the audio level started to drop and took at least 3 minutes before they completly discharged. Pretty amazing.

I wired them directly to the board, inside the tin, which I now realize was a mistake. Got to wait at least a minute for the voltage to drop enough to get a reset when changing filter boards!

I don't have the part number handy, but they were only $2.50 each. There's another type rated for 12 volts, but they cost $25.00. I wonder if its worth the price to try those?

72, Steve KD1JV

1464. First run of ATS-3B SOLD OUT

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-04 17:29:50 UTC
From: Steven Weber
Topic: 1460 Message: 1464

As of todays mail, I have orders for 93 kits. This effectively sells them out, as I really only have 99. So, if your order isn't already in the mail, no need to bother now. As soon as I can get all these out, I'll start getting parts for another 100.

I discovered over the weekend I bought the wrong type of trimmer cap for some of the filter boards. I got tricked into getting top adjust caps instead of bottom adjust types, as I didn't look at the part diagram close enough. Apparently, Fig 1 showed straight leads and Fig 2 showed kinked leads, and I thought they were top or bottom adjust types. Oh well, I only bought 1000 of them!

I was going to make you use the top adjust anyway, even though you'd have to temperarly place them on the wrong side of the filter board to adjust them, then move them to the other side. But, I was able to piece together enough bottom adjust caps of different values to make do from Mouser today to cover all the kits. These parts are in transition from leaded to unleaded so thier inventory is a bit slim at the moment. I guess they want to sell out what they got now before getting the lead free ones. I helped them out a lot today :-)

These should be here by the end of the week, and will try to have everything else ready for when they do. With any luck, mass mailing of the kits should start next Monday.

This group probably has as much SMT soldering experience as any on the web. I have seen the toaster oven and cup warmer methods described on the Electronic research Group page. Has any one used these methods? Any recommendations?

I have had good success using a sharp pointed iron and .015 solder - holding components with a tooth pick. But am always open to a better method.

I have built 5 or 6 ATS rigs with the sharp solder tip
and small solder. I have since switched to the oven
method and will be using it from hence forth. The hot
air method works for me too.

No more individual pin soldering for me!

I use Cash Olsen's method and it is simple cheap and works great. I
bought a one burner electric heater and a small pan at Wal Mart ($12.00)
which is the first heat source.

Then I bought on sale at HobbyLobby "the paper studio Embossing Heat
Tool" for $10.00. This heat source melts the solder and finishes the
heat work. You just stand over the small pan and blow the hotter air
over the card and the solder melts and all the things work.

1470. SMT soldering

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-05 12:33:47 UTC
From: John Shadle
Topic: 1470 Message: 1470

Maybe this is a basic question, but I was wondering how people dealt with double-sided PCBs with SMT parts on both sides. Seems to me that finishing one side in the oven (or on a beverage warmer a la <http://www.zianet.com/erg/SMT_Soldering.html>) and then turning it over and doing the other side would loosen the first side's components.

I'm clearly missing something.

Since this will be my first SMT project, I have one of the NorCal dummy load kits to practice on. If anyone has great resources for SMT soldering I would greatly appreciate it. I've also seen the weighted parts holders (using wire from a hanger and a fishing weight), so I'm open to anything...

Thanks.

I did my last double sided board with the oven method
all in one shot. Surface tension kept the bottom
components on the board no problem.

If this is your first try with SMD then I recommend
the hot plate/embossing tool method and go slow.

I know this is stupid as a lot of folks use this
method but won't the components on the bottom side
get cooked too much? I mean you do one side first,
(Probably the one with the most components) then
the second side? Lastly through the board stuff
and sockets?

Do one side at a time
The side that you have already done will not be a concern as you will
not get the solder thats already there hot enough to loosen anything.

Thanks to all for the response on SMT soldering. Many commented that Wal Mart no longer carries the cup warmer mentioned on Cash's page. They do carry candle warmers that are similar, however they are rated at 17 watts and Cash's cup warmer was 9 watts. Also, Hobby Lobby carries candle warmers rated at 15 watts for $3.99 (Their hot air embossing tool is on sale as well for $10.00). I have the 17 watt version from Wal Mart. I will try it and watch to make sure it does get too hot.

Stay tuned.

Do this Ken. Put a little water in the Candle Warmer and see if it
boils. If it boils in 3 minutes your too hot. If it boils in many
minutes your ok.

I ended up with two candle warmers. One rated at 17 watts and 3.5 inches diameter, and one rated at 20 watts and 4.5 inches diameter. I did Karl's test per below and neither boiled water in 3 min (or 10 min for that matter). Both got to very warm to touch. Must get a thermometer. At any rate, it looks like the larger diameter and higher watt rating get just as hot as the smaller. The heat distribution/inch is the same. As soon as I get the flux from Cash, will try both, but it looks like they will do fine.

1481. ATS-3B Digital Interface

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-05 23:27:48 UTC
From: kt4g
Topic: 1481 Message: 1481

I'm curious: How exactly does the digital interface for the ATS-3B work? It looks to be a one-way only deal that allows for transmit only. How do you rig it for receive? I have a UTStarcom PPC-6700 that uses a 2.5mm 4 contact plug (tip, sleeve and two rings), and assume that the headphone out on the ATS connects to the mic input on the pocket PC.

Forgive me for asking what may be an obvious question to some of you, but this is (hopefully) my first experience with a kit of this kind.

As you normally would, earphone out of the ATS-3B into AUX or mic input on a desktop or laptop. Most Pocket PC's - aka PDA style - don't have a mic jack input, so in that case, you place one earbud over the mic slots on the Pocket PC case and accustically couple.

The digtal interface is only used for talking to the ATS-3B so it knows when and what to transmit. Since the ATS can not directly use the normal audio modulation generated by the sound card as would be used in a SSB rig, a different system has to be devised. The Pocketdigi software by OK1IAK uses the sound card output to generate a UART serial communincations link to the rig and that information is used to direcly manipulate the DDS and keying as to generate the required modulation, at the proper baud rate.

1483. Re: SMT soldering

Topic: 1470 Message: 1483

In leaded (Pb) manufacturing, a standard double sided board goes through two reflow cycles and if it has through hole components it goes through a wave solder process which actually submerges the SMD components on the bottom side of the board in solder. The parts are held on the bottom side of the board with glue. In addition if rework is required most manufacturers allow their products to be subjected to additional reflow cycles and wave solder cycles.

In a lead free process the components are exposed to higher temperatures then in a leaded process. So in a nut shell you should be able to get away with exposing the board to several heat cycles without worry.

1484. RE: [AT_Sprint] Re: SMT soldering

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-06 13:02:04 UTC
From: Ken Lotts
Topic: 1470 Message: 1484

Since there has been so much recent reference to SMT soldering using variants to "Cash Olsen's method" I am compelled to offer the fact that not everybody solders with an oven.

I successfully use a Hakko FM202 workstation, an optivisor with #10 lens, A halogen work light, the supplied solder and some fine braid wick.
I occasionally use a hot air rework station purchased a few years ago from sparkfun.com very similar to the link below:
http://www.sparkfun.com/commerce/product_info.php?products_id=74
(Sparkfun is a very fun spot to shop. Always loaded with cutting edge stuff.)

I do my best SM work in the morning while fresh and alert.

1485. Simpler digital interface for ATS3B

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-06 15:56:53 UTC
From: Steven Weber
Topic: 1460 Message: 1485

I just tried out an idea I had last night to simplify the digital interface to the ATS3B and it seems to work. All it takes is two parts, a 47K resistor and 0.1 ufd cap!

The 47 K resistor goes from the Dash input to ground, which biases the port input pin to 1/2 the supply. The 0.1 cap couples to the audio out of the sound card. With the volume turned all the way up on the hx2495 PDA, there is enough signal to trigger the port and reliably send the Morse test message. Further tests will be needed to verify this is a reliable method, but it looks like it will do the trick.

Best thing is these two parts can be built into one of the cable plugs used to jumper from the PC to paddle jack. Just have to label the ends so you know which is which.

Steven Weber <kd1jv@...> skrev:
As of todays mail, I have orders for 93 kits. This effectively sells them out, as I really only have 99. So, if your order isn't already in the mail, no need to bother now. As soon as I can get all these out, I'll start getting parts for another 100.

I discovered over the weekend I bought the wrong type of trimmer cap for some of the filter boards. I got tricked into getting top adjust caps instead of bottom adjust types, as I didn't look at the part diagram close enough. Apparently, Fig 1 showed straight leads and Fig 2 showed kinked leads, and I thought they were top or bottom adjust types. Oh well, I only bought 1000 of them!

I was going to make you use the top adjust anyway, even though you'd have to temperarly place them on the wrong side of the filter board to adjust them, then move them to the other side. But, I was able to piece together enough bottom adjust caps of different values to make do from Mouser today to cover all the kits. These parts are in transition from leaded to unleaded so thier inventory is a bit slim at the moment. I guess they want to sell out what they got now before getting the lead free ones. I helped them out a lot today :-)

These should be here by the end of the week, and will try to have everything else ready for when they do. With any luck, mass mailing of the kits should start next Monday.

I thought about this possibility before, but I compared the audio levels with the threshold of MSP430 Schmitt trigger inputs as defined in the datasheet and I rejected it. If it works for you, it is great. I wonder how reliable it is.

If it does not work reliable, one can increase amplitude by a small step up audio transformer.

1488. Production ATS-3B manual

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-11 01:55:20 UTC
From: kd1jv
Topic: 1488 Message: 1488

Hi Gang,

I just up loaded the final, production version of the ATS-3B manual. If you have copy of the preliminary manual on your computer, I would suggest deleting it! I found several errors in the assembly instructions and added a couple of new functions to the rig like using the tuning buttons as a paddle or straight key.

I belive I have found all the bugs in the new firmware, but its hard to be 100% sure when there are 2800 new lines of code, in addition to the 4000 which were already there! If there are any lingering bugs and they should be minor things which don't impact the operation of the rig. In any event, I've run out of time and what I got is what you'll get!

It's quite possible I'll start shipping kits as early as tomorrow. They won't all go out at once, as I can't tie up the PO all day! There'd be a line out the door behind me and a lot of unhappy people. They will go out 10-20 at a time as I can get them packaged up and labeled. So if anyone says "WOW I got mine" and you haven't, yours will get there eventually.

Okay, guess I better start burning CDs!

Date: 2007-09-12 18:06:01 UTC
From: Paul
Topic: 1489 Message: 1489

Clint Eastwood once said, "...A man's got to know his limitations..." I recently tried to build a simple solar power regulator (about 10 parts) and needed a magnifier to read the standard resistors.

So,is there an acknowledged list of potential builders for the AT_Sprint? Or would the best way be to read past posts, see who have built several and inquire if they would like to build one more?

Does the Altoids tin give it mojo or is there another popular housing?
Thank you and 73,
Paul

1490. KX1 and ATS and Digital

Date: 2007-09-12 18:12:16 UTC
From: Paul
Topic: 1490 Message: 1490

I did a search on KX1 first and didn't see too many "comparison" posts. But in general is seemed the KX1 had the convenience of band switching without switching cards and a visible readout, and SSB/AM general coverage-ish RX. The ATS had a better filter, lighter weight, more power per battery juice.

But now I've read that the ATS will do digital modes or mode = PSK31. Is that true - part of the design? If I have a small XP laptop, what would it take?
Thank you and 73,
Paul

Hi Paul, the ATS3B will do psk31 but it is just being shipped to the
first 100 buyers. My older plain ATS3 will not do digital and is in an
Altoids can and runs near 5 Watts on all bands.

So if you want the ATS3B send your money $190 to Steve ASAP so you
will get on the second 100 list...

Hi Paul.

> But now I've read that the ATS will do digital modes or mode = PSK31.
> Is that true - part of the design? If I have a small XP laptop, what
> would it take?

You need only a simple interface cable and PocketDigi software
http://pocketdigi.sourceforge.net
You will be able to work BPSK31/63 modes, RTTY, MFSK16 and Olivia. All types of Olivia may be modulated, but the ATS-3 filter is narrow, so only 250 Hz wide submodes are possible to receive.

For details, look into ATS-3b manual, which is published in the files folder.

Kurt-

Your suspicion is correct. Each piece of coax has their braid connected at only one end.

The coax closest to the rear(between points TERM1 and TERM2), and connected directly to the jacks, has it's braid connected in the left hole marked 'BRAID'. This hole is directly behind the solid wire jumper on the board.

The coax closest to the front (between the points TERM3 and TERM4) has it's braid connected only on the right hole marked BRAID.

In both cases, the opposite end of each coax braid is -not- connected to anything.

The braid acts as a fariday sheild, which is why its only grounded on one end. Its also suppost to reduce sensitivity to harmonics, which of course, you shouldn't have much of anyway!

Thanks Steve,

Would it matter if I grounded the braid at both ends?
If it doesn't, I wouldn't bother clipping the one end
and recalibrating. I do have a small HF rig I could
plug into it and see what the power output is.
(I have a few others I need to build.) If it does
matter, I'll cut one, reinstall the test point jumper
and re-calibrate. Gosh I feel stupid.

I see some of my high powered amateur rocketry
brethren will put a wire mesh faraday cage around an
electronic deployment altimeter to shield it against
stray rf
that might cause the altimeter to fire ejection
charges at inappropriate times. This is done if a
high powered tracking transmitter shares the same
electronics bay.

Kurt,

If both ends of the shield braid(s)are grounded, then it really does
act as a shield, so the magnetic field will not couple to the winding

(s)on the toroids; this means the wattmeter won't work right. Steve said it exactly right - if the shield is grounded at one end only, it acts as a Faraday shield, which means it reduces capacitive coupling while still allowing magnetic coupling. The WM-2 is a nice tool, and you'll enjoy using it if you can duplicate the directional couplers as they are intended to be built. Please consider using new coax to rebuild them - don't try to re-use the old melted coax. These coax lines are the very heart of the bridge, and they need to be symmetric and 50 ohms for the instrument to work as designed.

Of course you could also build one of Steve's QBSA units - it too has a clever directional wattmeter and works nicely!

Date: 2007-09-13 06:07:30 UTC
From: radio_kx0r
Topic: 1508 Message: 1508

Steve,

Will my QBSA work with the new ATS-3B? (I just realized we haven't asked about this, or else I missed it.) I assume most of it would work, but there could be a few issues related to the new bands or maybe something else.

Probably the wattmeter will be OK at 21 Mhz or even higher. I wonder if the frequency counter will work OK with the new LO frequencies? It looks like the same mod to get the LO out to the QBSA will be required.

Please comment when convenient if you have tried the ATS-3B on the QBSA yet - I know you're busy making and sending kits...

Thanks!

Thanks all for the info. I believe I will be able to clip the offending end, repair the test jumper and recalibrate. I see now I missed some key points in the written instructions in that step. Still would have been nice if the photo of the completed board would have been in the instructions instead of having to go hunt it up on the web. I would have caught it.

One more "use" question that I couldn't find an answer for. If I calibrate the meter for battery use, will it need to re-calibrated if I were to use it on external power? If so, I might best be served to wire a switch into the calibration jumper that one cuts after calibration? Then I could recalibrate more easily?

So you don't have to search like I did, Jackie is referencing the
September 2006 newsletter, not 2007.

Kurt,

I just had a look at my WM-2 manual, and I think I can answer your questions. The calibration jumper is used to create some DC reference voltages that are used only during calibration. After that, the jumper is cut, since those DC voltages are not used in regular operation. The only reason for the cal voltages is to set up some gain pots for the various RF power ranges.

During calibration, the DC reference voltages ARE sensitive to the power supply voltage, whether it's from a battery or an external DC supply. There's no internal regulator in the WM-2. So you must use the same supply until you're through calibrating. Use a fresh 9V battery and you'll be fine; or use a regulated external supply - leave it set to the same voltage until you're through with the cal.

After you cut the cal jumper and use the unit for normal operation, the DC supply, whether battery or external, is only used to power two op amps; these op amps, by their design, are relatively insensitive to their supply voltage. So your RF readings will not be affected significantly, whether you run on the internal battery or an external supply. Only one calibration is needed. This is one of the nice

features of this wattmeter.

However, if you like to fiddle and tweak, you may eventually want to go back in and recalibrate some day...maybe you'll do what I did, and check your WM-2 against other measurements or instruments and discover errors, so then you might want to recalibrate. You really might want a switch in place of the calibration jumper.

Measuring RF power accurately is difficult with inexpensive test gear. The WM-2 does a good job, and its accuracy is adequate for QRP testing and experimenting. The large analog meter is convenient. However, the various scales of mine don't track perfectly from one to the next, revealing errors.

Around 50 Mhz this unit is struggling with respect to several parameters, although it may still be useful up there if you know its limitations. I checked mine with a MFJ-259B antenna analyzer and found that the WM-2 has an SWR of 1.0 from 1.8-25 Mhz, 1.1 from about 26-43 Mhz, and 1.2 up through about 60 Mhz. It gets worse as you go up from there. My short cable and test load measure an SWR of 1.0 beyond 100 Mhz, so I'm sure that the WM-2 is causing the impedance bump. Through 10 meters it will do a great job for amateur work, but it's not accurate enough to set up a 6 meter beam, for example. Use an antenna analyzer for that kind of work.

One of the checks for your WM-2 is to hook it up backwards and measure power in the reverse direction. This serves as a symmetry check for the sampling RF transformers. If you don't get good nulls both ways along with nearly identical power readings, you have some difference in the two couplers and their circuitry.

I think you'll like your WM-2 (I like mine) - I recommend it to anyone with the remark that although it's not a precision device, it allows us to make useful measurements and comparisons of our QRP equipment. If you need to peak up a QRP final, or adjust an output filter on an ATS rig, this is the meter you want.

Happy Tweaking!

Yeeeehaaaa George,

Thanks, that's about all the information I (a neophyte) or any other interested party would need to understand the WM-2.

Paul I was the first to order the ATS3B kit from Steve but then
about a month later my hands got a bad jitter. Went to my Doctor and he
was no help. Another Doctor now has me on med's and it seems to be
working. So I turned off my order. I think it was the best move.

So be careful who you tap.

It should. In thoery the counter is good to about 45 MHz and I got a report
from a builder who said he tested the watt meter up to 6 meters and it was
still accurate.

BTW, I only have about 30 of these left.

Will you be able to reprogram these to handle the
extra bands of the 3B? Would they still be backward
compatible with the previous versions?

From: kd1jv
Topic: 1517 Message: 1517

I found this link on the NEQRP page http://www.hotamatuerprograms.com

There's a bunch of sound card programs there, I tried out the audio spectrum analyzer/audio signal generator. Its a bit strange in how it works, but looks like it would do the trick for peaking up the ATS-3B if you don't have a scope. Its a fairly small down load. Just be sure to unzip the files into a folder you can actually find later!

Don't need to. All the higher bands are low side injection, just like all the others but 80, which is the special case. The IF frequency is the aame as before so it will work just fine as is.

The only thing I'm not 100% sure of is if the counter input will be sensitive enough at the higher frequencies. I made a mistake on the board layout and placed the inductor which is in series with the (Q2 if I remeber right) collector resistor on the supply side of the resistor instead of the collector side. The inductor was suppost to make the transistor have more gain at higher frequencies, but doesn't do much where it is now. One could always swap the inductor and resistor, but they are different sizes so don't fit the pads very well or I would have had you all do it that way before.

> Put all the smd parts on my 3b this am.

Mike, I figured it wouldn't take you long to get the thing assembled.

Beware that the ATS-3A board is a slightly different size than the ATS-3A board and will not fit in a box drilled for the ATS-3A. (I can't use my old carbon-fiber box unless I replace one side panel and move two board mounting screws.

After doing three cases for the ATS-3A and getting none exactly right, I decided that the bare board is the best template for hole placement. I spent the morning rounding the board's corners and marking and drilling an Altoids tin. I snapped the power connector into the board so that I could get the board positioned with the end of the power connector flush with the inside of the case.

At a minimum, many of the capacitor reference designators need to be updated. The numbering of them on the ATS-3B schematic mostly matches the ATS-3A instead. I haven't looked closely at the other parts yet.

It might also be worth fixing U5's pin numbering to match the part's data sheet, but this could create some confusion since it's also this way on the ATS-3A schematic.

From: kd1jv
Topic: 1536 Message: 1536

Sorry about that guys. Apparently I forgot the go and renumber the caps on the schematics after fiddling with the board. I got most of the resistors right :-) I noticed a couple of other things while I was checking, like no pull up resistors on the paddle inputs and no by-pass cap on the band select voltage input. Minor details that I hope are all squared away now.

Yeah, I had to make the board a tad larger to accomidate the bigger
MPU, display and new mounting stand offs.

And say, if anyone comes up with some neat graphics for the front
panel, up load it to the files section, eh?

I'm catching up to you. I'm at the same point. Took about 2.25 hours to get all of the SMT stuff on by hand. Some of that time included spending 5 minutes getting the display positioned just right. The pad spacing on the board was slightly off, so I wanted to make sure I had the display centered to avoid any chance of a short. Another hour or so to get the through-hole stuff mounted.

Also spent a bunch more time on the tin getting the holes exactly right (fourth time is a charm). Just need to enlarge the holes for the phone and paddle jacks and then make the hole for an SMA connector.

No band modules yet, but I stuck a wire on C1 and do hear a change in the noise, so at least something is propagating all the way through. I'm going to build 40M next and hopefully will be using the ATS-3B instead of the 3A for the Run for the Bacon tomorrow.

From: Dave
Topic: 1539 Message: 1539

Steven, thanks for the updated schematics. Now I have a few comments
on the build notes:

Page 15 - On the board map, R8 should be 1133, not 1132.
Page 16 - R44, 22K, needs to be added to the table.
Page 16 - Indicate that there are only one of each of the leftovers.
Page 17 - Add D2 and Q6 to list of items to be installed on Front.

Note that there are two items identified as U11, the oscillator on
the Front Side and the reset chip on the Back Side.

Hey Steve and the gang;

Thanks for taking the time to correct some stuff. It definitely helps. And appologies for making 'misteaks' is nice, but as far as I am concerned not needed. (i.e. I make all kinds of 'misteaks' with complete regularity. And if you doubt my sincerity about this, just ask my wife how many 'misteaks' I make. I am pretty sure she would be more than thrilled to tell you guys all about it.)

Um, one additional thing I did noticed on the pdf download...it says it is for the ats3A on the second page.

OOPPS... (that's just like the kind of 'misteaks' I make...)

Hey I gotta run, I think I hear my xyl calling me about something I messed up again.....

Subject: [AT_Sprint] ATS-3B goes DIGITAL!

Well, it always was sorta digital, with the uP, DDS and all, but now it will talk digital! (though strickly speaking, CW is a digital mode, just the oldest)

Many thanks to OK1IAK who wrote the digital modulation and sound card communications interface which made it all possible. I would have though it wasn't. Glad I was proven wrong.

It took me awhile to get what Vojtech wrote for the 3A to work in the 3B, but it finally does! I can copy myself sending PSK31, BPSK63, RTTY, MFSK16 and even CW sent from the keyboard of the PDA. It doesn't seem to like sending QPSK31 for some reason, but no one uses that mode anyway, so who cares? There are several other digital modes available, but I don't have the software to receive them. Vojtech says they work. He's also working on adding more modes too. Amazing.

Of course, these modes will only work with the Pocketdigi software. Any other digital mode software doesn't have the unique sound card control communications needed in them. Those programs are ment to be used with generic SSB rigs and we're special.

To top it off, I added a reverse paddle sense for you left handed ops and implemented the "stealth paddle" which enables using the tune up and tune down switches instead of an external paddle. Though using the switches isn't the easiest way to send Morse and will take some practice to get used to, it does work.

Whew, glad thats all done. Maybe I can get to bed a little earlier now. Though there is the manual to finish and parts to be sorted and bagged.

hi Steve,

so.., may not be needed but, the optimal configuration would be to
physically switch L1 and R18 on the board so that they would then
actually match what is on the schematic.

am i correct about switching L1 and R18?

tnx

Mike is your embossing tool Pink? I was told at Hobby Lobby the one
I got for $10.00 was at half price because it is Pink.

It looks as though I will be using mine next week. I hope I can get
the parts stuck close to right in the solder paste. Old age is getting
to be a problem. But it beats the other.

From: Dave
Topic: 1548 Message: 1548

My ATS-3B is up and running on 40M. Not quite as much output power as my ATS-3A, but it seems to be running about the same as the 3A did before tweaking its filters.

One thing to watch for: You might trip the 3B's overcurrent protection if you try to run on a 3-cell LiPo and the antenna is not properly tuned. I have to use my 2-cell LiPo for tune-up before switching to the 3-cell.

Congratulations,
I can't believe how fast y'all are getting these built. With my two young children running around I can't get out the soldering iron out until they are asleep. And most of the time I'm too tired to solder. I order some solder paste. I going to try it out on a Norcal dummy load and a tunner upper before I try it on the ATS 3b. I'd hate to over cook it and ruin it.

Where did/do you buy the 2 and 3- cell LiPOs? I'd like to get some.

I got them from http://www.aeromicro.com/ and http://www.allerc.com/.
You'll need one of the special chargers to go with them. Search the
messages here for warnings and details on LiPo battery care.

I got the 80M module assembled just before the Run for the Bacon and
used 40M and 80M with results equal to what I would expect from my 3A.
80M seems to have a full 5W on the 3-cell battery (same as the 3A).

I have been getting my lightweight 200 mAh LiPo's from http://www.batteriesamerica.com . Two of them provide about 8V for the duration of a 2-hour sprint with 3W out. My ATS-3 has a 2-cell, 650 mAh pack, but the ATS-3A uses only two 200 mAh batts. I am still looking for some ultra-lightweight batts for my hopefully, soon-to-arrive, ATS-3B.

1554. E in display on initial power up

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-17 17:14:24 UTC
From: n2uz
Topic: 1554 Message: 1554

Hi there,

I just applied power to the ATS-3B and I am getting a "E" in the display with no 8 in the headphones. I can hear background noise.

L3 is not installed yet but the following are OK.
The 3.5 and 5v are OK.
TP1 is 3.96v OK
The PA gates are at 0v. OK
I can hear the dits and dahs with a keyer connected. OK
The PA keying transistor is near the DC supply while sending a string of dahs and slowly goes to zero when I stop the dahs, BUT I do hear dits when it gets near zero.
I can display the battery voltage (Menu and up key). It outputs to the headphone and also to the display. OK

Note: The correct 8(cw and display) did come up once or twice out of 25 or so turn ons.

Any ideas as to where the problem might be and should I go ahead and install L3 and continue on with the Reference, Local oscillators and band filter tests.

From: ak3f
Topic: 1555 Message: 1555

i am very new to hot air methods of soldering smt components.

1. the hot air from pencils, embossing tools, toaster ovens etc. why does the heat not damage the components? is it because the smt parts are all added prior to anything that would be ruined by such heat? is hot air typically used on the whole board only once during the initial installation on an otherwise naked board?

2. if the above is true and rework is necessary, then i suppose conventional soldering techniques must be used to prevent damage to non-smt parts, except perhaps if you are a careful expert and are using a narrowly directed hot air pencil?

cooking a circuit board in a toaster oven or in a electric skillet seems awfully brutal.

I am sorry but your information is garbled. The way you do it with a
toaster oven is much different than the Cash Olsen method which used by
most people. If you want to learn this method put Cash Olsen in Google
and read his web page. I suggest you buy a cheap SM kit and build it
first. I did that and it really helps!

Its possible you have an intermitent in the power jack or plug. Or, your pulling it out and pushing it back in too quickly. As explained in the manual, you have to wait 2-5 seconds after pulling the plug before putting it back in again or its likely to think it got an overcurrent rest and display the "E". This is a side effect of the MPU not drawing much current and takes awhile for the voltage on the filter caps to get low enough to corput RAM data used to tell if its powering up from a cold or warm state. I felt this was better than just doing a normal reset. If the overcurrent detector tripped while adjusting a tuner and it did a normal cold boot, you'd loose the frequency you were set at and you'd wonder why the rig just did something weird.

If the things listed below are working, then I take it you can clear the "E" by pushing the Menu button. The "E" can't come on until the MPU has done a complete initilization at least once.

Topic: 1560 Message: 1560

I was one of the first checks to Steve Weber for the ATS3B Kit.
About a month ago I sent Steve an email asking him to tear up my check
because I am having trouble with hand and arm movements brought on by
some kind of palsies that makes putting on the small parts a real
problem. I bought a set of good tweezers (4 each of of a special shape
for working with Gold jewelry).

It is 3:30 PM and too late to start trying to do this kit. My Wife
threw out my Cash Olsen solder laden paste so I will need to get more.
Cash lives here in Las Cruces so it's easy to get more.

So I have an unopened ATS3B kit that I am worried about trying to
build. I'm 72 years old and the vision and such are poor when compared
to 5 years ago. I still have and use my ATS3 which I had to send to
Steve because I put the pull-up resistor chip in backward. I was sure it
didn't matter :-)

If your waiting for a kit I will send you mine for the same price
$190.00 plus postage of about $3.00 if mailed to anywhere in the USA.

There are several of you, and no doubt a growing number of you planning to--use the digital modes with your 3B. What PDA or palm device are you using? What are the requirements for a device that is interfaced with the 3B?
I have been snooping around in Akihabara, and there are dozens of different used models quite cheap. Basically obsolete except for working well in this application.

Mike, i the components can take the heat for a short time...that's the way they're reflowed in production, either by Vaporphase, IR ovens, etc...

The shorter the time, the better...

I belive you will need one that runs Windows CE or Mobile, so that
probably eliminates the Palms. Vojtech would know for sure.

I don't belive I ever got that message Karl or would have done as you asked. I had already mailed the kit before I saw your other comment about the health problems and of course, it was too late then. If you don't find any takers for the kit, send it back and will refund the money, no problem.

This is the reply Vojtich sent when I posted a similar question:

"I develop PocketDigi on an old iPaq 3630 with Pocket PC 2002 system, 32MB ram and 206MHz CPU.
Generally, anything manufactured in 2002 and later shall work with PocketDigi.

It is possible to couple RX with Pocket PC by placing an ear bud on the internal microphone and it even works quite well, if you are in a quite place. But I would rather recommend to get hold of a device, which has external microphone input. Patrick N0HR compiled a list of devices, which supposedly have it. If the device has no mic input, you may hack it as I did.
http://www.n0hr.com/PocketDigi/PocketDigi_Tigertronics_Interface.htm

It is hard to recommend a particular device. There are a lot of them on the market and it is up to your taste. I would probably pick something newer with internal thumb keyboard. I suppose you may buy some Windows Mobile communicator from your cellular provider quite cheap.

If you are lucky, you may buy Jornada 720 on e-bay for hundred bucks. Jornada 720 is quite old design running Windows CE 3.0, no more manufactured, but it has a decent internal keyboard and 640x240 display. Handheld PCs are discontinued in favor of Windows Mobile devices. I still support Jornada 720, because some HAMs use it.

If you have more questions, please subscribe to hampocket at yahoogroups. Search the archive first and place the questions there.

Hello Joe.

> Has anyone measured the transmitted IMD for this mod?

I did not "measure" IMD of PSK31 transmitted by ATS-3a. On the following page, you will find screenshot of waterfall and sound file of PSK31 signal sent by ATS-3a and received by Sangean 909 short wave receiver. On the waterfall where the sidelobes are quite strong I suspect the receiver was overdriven.

http://www.kufr.cz/~ok1iak/temp/bpsk31-ats3-proof-of-concept.htm

The signal is not clean for sure, but I made tens of QSOs without any complaint. I bet the other party saw only the main lobe on their waterfall when transmitted with 2 watts.

If the 80M band module or no band module is installed, even 20 seconds of power off is not enough. The main current drain on the 3.5V filter cap is the band indicator resistor on the band module. since 80M has no resistor, the cap takes a long time to discharge.

I see a few ways to deal with this. If no module is installed, with power disconnected hold down one of the buttons for 4 seconds (or all four buttons for 1 second) to discharge the cap. For the 80M module, you could install a 30K resistor as the 80M module's ID resistor. 30K should be large enough to distinguish the module from the 40M module.

Alternatively, to handle either case you could just put the 30K resistor across C58.

Actually, the Ref clock and digital section of the DDS are also on the 3.5 volt supply, but I suspect these shut down and stop drawing sigificant current well before the MPU shuts down, as it is in sleep mode, drawing next to nothing for current and it can keep running down to about 1 volt.

The "E" thing was a last minute addition and I happened to have a 20M module installed at the time I tested it and said, ok, we can live with that. Always something! Gonna have to think about this for the second round of kits!

Hi Vojtech,

Some of my initial tests indicated that simple DDS phase inversion without envelope shaping produced a received "IMD" level of about 18 dB, as indicated on the decoder program's IMD meter. The main reason I ask about this is to determine if the improved envelope shaping in the ATS-3B provides an improvement in PSK31 sideband control (or "IMD" as many call it). A more basic question might be "does the firmware in the ATS3-B even attempt PSK31 envelope shaping?" I guess Steve would have to answer that, To make it work with shaping, the RF would have to be off at the instant a DDS phase inversion takes place.

If you pound a 20 over S9 signal into the monitor receiver, you do see some hit of sidebands on the waterfall. But if you back off the coupling so that the signal is a more reasonable S4-5, it looks no different than an off the air signal.

>call it). A more basic question might be "does the firmware in the ATS3-B even attempt PSK31 envelope shaping?"

Only the intrinsic CW wave shaping, which has about a 2 ms rise and fall time now.

I guess Steve would have to answer that, To make it work with shaping, the RF would have to be off at the instant a DDS phase inversion takes place.
>

The transmitter keys off before phase inversions, then keys back on. I did try to PWM the PA voltage to get a waveshape similer to what a sound card generates, but with no luck. The way the keying circuit is set up is not condusive to PWM. It would really require a DAC and sine look up table. The on off keying scheme works well so there's no need to go to the trouble of adding a DAC at the power levels the ATS produces.

1585. Solution for "E" on power up

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-19 20:38:22 UTC
From: Steven Weber
Topic: 1439 Message: 1585

A 22K resistor arcoss the 3.5 V supply is enough of a load to eliminate the "E" coming on with short power down/power up cycles. A good place to tack a 22K resistor is at the clock osc, from pins 4 to 2 or 1 to 2.

Howdy Mark,
So you have the solder in one hand, the soldering iron in the other hand, and how do you use the tweezers to hold down the part? Do you lay the tweezers on the part? How's about a photo?
My doofus was much like what y'all have built. Using a toothpick for the business end. Mark's right--it does take quite a bit of time to place the component, put the doofus holding it down, then pick up the soldering iron and solder to go to work.
Maybe we're using a different technique?
Jonathan

You melt a little bit of solder onto one of the pads on the board, put down the solder, pick up the part with the tweezers, position it on the pads, and reflow the pad you just tinned while positioning the part in exactly in place. After that, it's easy to solder the remaining pads on the part, as it's locked in place. I've built many dozens of boards like this, and if you have the right tools and the right skills, you can fly. It's a 2-hand operation - no 'doofus' required. You can easily solder fine-pitch IC leads too. Just position and solder one corner leg as described above, then fine tune the rotation of the part on the pads, then solder all the remaining legs without regard to bridging, then come back with some fine solder-wick and wick away all the excess solder. Works every time for me (and all my technicians), but I've been doing this for years. I tried to get my techs to use the "Cash Olson" reflow oven method, but they said they can move faster soldering by hand. Your results will vary, so you should do whatever you feel most comfortable with.

There is no question that a well trained person with good tweezers
can do an ATS kit in short order loosing few chips to loss.

The Cash Olsen method requires this same skill but with a HUGE
difference. First you put some "solderpaste" on the pads you want to
work with. Lets say it is the .01 uf capacitors and there are 16 of
them. You put a tiny amount of the paste on the 16 pads with the
hypodermic and needle. Now you pick up one capacitor and put it in the
paste at the first location. Get it "about right". Do this 16 times and
all the .01 uf capacitors are on the board. Go on to the next item.

Your looking at the manual to see where the components are going to
be mounted. This you must do with both methods and it takes time. Make
sure you do this right.

When you have every component mounted on the top side except the
plugs that are plastic and might melt in the high heat, you look the
board over with care and make sure nothing fell off or was moved too far
from it's pads, and then in 15 minutes you "solder 563 pins". The
amazing thing is that all the tiny chips are centered on their pads.
This is due to a complex factor of the pre-soldered pads acting on the
components just when the temperature reaches the melting point of
solder. It works.

Again look at the almost finished top side. If there are any solder
bridges use "Solder Wick" to clear them. When done start on the back
side. Mount everything in the paste and when done and checked put the
board back in the pan with back side up. When done cooking the back side
let the board cool off and check for any problems.

Now mount the plastic plugs with your soldering iron and the board
is complete and ready for test.

I've been doing surface mount ops just as Joe described for some time now. Both my ATS-3 and ATS-3A went together via this process. I grind down a soldering-iron tip until it is an ultra-fine point, use the solder that comes with the kit, and get after it. A steady hand and lots of light and magnification take care of the rest! I got the ATS-3B manual printed yesterday, and have cleared some calendar space over the weekend for some serious soldering fun. By the time I am through with an ATS kit, my ultra-fine-point soldering-iron tip is ready for another trip to the grinder, or replacement.

My first ham kit was an AMECO AC-1 in 1969. No extra light or magnification was needed...

Unless you do it for paying customers (which I often do, either my day job or home business). In the case of kitbuilding, what would you rather be doing, spending weeks putting on the parts or weeks operating the toy?

If you need the "doofus" because you have a hard time due to a handicap of some sort that's one thing, but otherwise I see it as a huge impediment to efficient construction.

W3JDR nailed it. Everyone has their subtle differences in technique, mine is to tin one pad of each of the parts of a "run" (single value, one section of the board, etc) then place them all at once. Once they're all tacked down on one end, go back with the iron and solder (2 hands) and tack down the other end or remaining pins. When you have a build involving 4 or 5 thousand parts at a shot as I have done, you can't be dorking around with a fixture on each one. The only real risk is you might skip over a part or two on the 2nd pass, so close inspection is required. The same issue exists with hot air reflow and parts that tombstone or don't wet, so there's no magic formula for 100% success.

I've played with some of the other reflow schemes and they all work OK. There is probably a happy medium between using either technique (iron or reflow), so it's probably a good idea to be versed at both. The equipment investment is minimal, so there's really no reason why not.

Another technique I use is to color the pads with different color Sharpies. You could color code your entire PCB if you wanted to, which will help minimize placement errors, especially on boards like I make without a silkscreen. Not sure if Steve did this with the 3B, but on the ATS3 I built he color coded the strips of parts- great idea. You could match the colors you put on the board to those of the strips. You can spend a lot of time hunting between the pictorial, schematic and PCB to place one part at a time, but color coding makes it quick and easy. As soon

as you touch the pad with an iron the ink vaporizes.

W1RT mentioned:

> Prep the pad with a swipe from the liquid flux pen, it'll
> suck the solder right off the tip!

That's another "trade secret"- liquid flux. Depending on what I'm building, sometimes I'll brush the entire PCB with liquid flux and let it dry. Since I make most of my own PCB's I don't normally tin plate them so the flux helps burn through the inevitable oxidation that is present on the bare copper. You can buy small bottles of rosin flux from anyone that carries the GC Electronics brand. One bottle has lasted me about a decade so far. Flux is especially critical for fine pitch IC's or BGA's.

I think if I had to spend 2 minutes messing with a "doofus" to put each and every part down on a kit, I'd hate SMT too. Practice with the tweezer technique and pretty soon you're putting them down 100 or more an hour.

Pre-tinning a pad. Clearly the key difference in doofus use vs. not needing one. Steve, I suspect I may rightfully consider you an authority on this. For the smallest of the components, did you need to wick off very much excess? There's a lot of talk about methods--but those who have a tried-and-true iron method seem to be of the less-talk-more-soldering school.
Could we get a photo or two of your soldering iron tips, those of you who solder even the smallest components with an iron and wick?
Thanks,
Jonathan

My only real experience so far is with the monster parts in the ATS-2.
Details are at: http://www.al7fs.us/AL7FS5ATSprint2.html

Concerning pre-tinning, I wrote, "Place the part, put the doofus on top, use the solder provided or the smallest you can possibly buy, and go for it. It is actually pretty painless. When I built the SMK-1 kit, I first tinned a tiny bit of solder on one of the pads. I tried this again for this kit and did not like the results, at least for me. This method seemed to make the parts move off center and look bad. My three fishing-weight doofus held the part firmly enough that I could just go for it with my 700 degree soldering tip."

The tip photos are included in the article.

I don't have photos but mostly used a PTP-7 for my
Weller. It's good for 0805 parts and bigger. For
really small (0603) I used a PTS-7. The standard tip
on my Weller was a PTA-7. You can look them up and
find pictures on the web easy enough.

New to the group, and would like to give a ATS-3 a try.
If you have a kit that you never got around to assembling, or will be upgrading to the new ATS-3B.
Please contact me off line with the details (ie. version, condition, and asking price), and
pictures if you have them.

Thanks / 72's

mouser probably has it as well

I recommend that the pad-tinners give my way a try. You need a small tip (I think mine is an EMA, 1.2mm narrow screwdriver) and small solder, just flux both pads, touch the solder to the tip so you get a little pillow (should be wetted to the tip, not blobbed out), place the part with tweezers and swipe the tip across the junction of the pad and the part. I run around 675 degrees.

Actually, in not recommending using liquid flux, I had in mind when it's used in excess, covering the whole board with a layer of the gooie stuff that comes in a bottle. When done that way, it makes a mess and causes problems. I had a board sent back to me built that way once and had to remove pretty much every part, clean the flux out from under it and put the part back in before it would work properly. Heck of a job.

A little tiny dab of dilute flux from a pen, placed just on a pad would most likey be fine, though I've never found a need for it.

Actually, the flux pen contains flux dissolved in some kind of
fast-drying solvent. You just wipe the pad and it dries to a sort of a
powdery residue. If you're hitting the joint with solder, you get
rosin from the core so you really don't need it. If you do the
solder-on-the-tip method, the flux is gone by the time you get the
solder to the joint ..

For SMT, I use nothing but Kester 2331-ZX water soluble liquid flux and #331 solder (containing the same water soluble flux). Looks like they are dropping the leaded versions, though. A simple water rinse (mandatory) and air blow dry and all of the flux is gone. I switch to rosin core once I start installing the parts that I would rather not wash, like the trimmer caps, buttons and the crystals (too tight to the board).

Hey gang;

Um, it might be very wise to stay away from any of the "water soluble" stuff, as it HAS TO BE cleaned off rather thoroughly. And by a specific water rinse. <- Too much time and trouble considering that a water rinse is not needed if you choose another kind of flux like either Kester 951 pen (or the RMA Kester stuff...I forget the number for the pen, but the catalogs all have it).

Then after I am finished soldering I just use one of the cleaner pens for use on soldering residues and just wipe.

Lots of pens I guess !!

From: w9ya@qrparci.net
Topic: 1577 Message: 1616

Hey gang;

Here are the specific part numbers of the pens I use:

- Kester #951, for use with the Kester #245 no-clean solder (No-Clean Flux)

- Kester #186, for use with the Kester #66 or 66/44 R(M)A Solder (Rosin Flux)

- Chemtronics No Clean Flux Remover Pen

- Chemtronics Rosin Flux Remover Pen

The general procedure I use is the No-Clean flux pen touched lightly to the pads and then placing the part and then solder lightly touched to the tip of the iron. The final step is touching the pad AND the held part simultaneously with the iron tip. Hold for two seconds and then lightly move the iron around for another second or slightly longer to flow the solder evenly. You will know when it is done right, as the joint will be nice and shiny and slightly concave if you didn't use too much of the flux or solder.

For clean up I then use the Chemtronics pens, starting with the No-clean one and IF I am being really anal-retentive, I will follow that up with the Rosin one (which is mostly alcohol and the first cleaning pen is not).

As previously mentioned the No-Clean flux pen is low-solids, so you should not have any issues with your circuits failing due to the flux, as long as you don't go overboard on its' application.

Oh yeah; I had lunch yesterday with Mark, K5LXP, and he was quick to point out that he forgot to mention (in his post from yesterday morning to our group) that a HOT iron with a sufficiently large tip is required for this stuff. Not too big but you can go too small. And you can use too little heat. He (and I) recommend a tip set for 700 degrees and NO filing down of the tip. Get a smaller one instead, as you ruin the composition of the tip if you start filing away at it. It is o.k. if the tip is as large, or even slightly larger, than the work at hand. I would add that a slightly chisel-shaped tip is handy as well, but not absolutely required.

(With too small tips and too little heat you loose the thermal mass that makes soldering easy and trouble-free. AND with no-clean flux you gain complete freedom from potential latent corrosive problems of the other fluxes and especially the water-soluble ones.)

1617. The easy way to solder small items

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-21 14:20:51 UTC
From: Karl Larsen
Topic: 1617 Message: 1617

All this talk about liquid flux and special rigs to hold the chip
while you manual solder the thing makes me weak at my knees. There is a
lot better way to do this. Look at:

http://www.zianet.com/erg/SMT_Soldering.html

and see how cheap and easy it is to use this method. The solder-paste
costs $5.00 and it is enought to build this and the ATS3E :-)

That's why I specifically mentioned the Kester 331/2331 stuff. Other water soluble fluxes are pretty nasty, but the rinse for this stuff requires nothing special. I prefer hot water, but cold water works just as well and blowing with air eliminates all the dissolved remains.

Hey Dave and the gang;

My experience with the water soluble stuff is from long ago. And it
still scares me !!

But I will definitely consider your experience if I choose to use it. It
is nice to know they improved that product type.

For me I still want to clean up with solvents, for whatever (peculiar)
reasons, so I would end up using the same kinds of things I am now, even
with the water rinse. <- All of which is probably not necessary with the
procedure you recommend, but .....

Thanks again for the info OM es

I built the ATS3A not using Cash Olsen's method. The first tool I bought was the micro fine tweezers (EROP5SA) and after soldering several parts I got round to installing U7 and held it with the tweezers only to have them slip and have the chip fly off somewhere. I never did find it, so it's still in my shack somewhere. Steve tells me that chip happens to be the most expensive part in the rig. Also had that happen with a couple of resistors.

SO NO MORE TWEEZERS FOR ME!

I finished using beeswax and toothpicks. A dab under the component to hold it in place and a dab on top to carry it (not sure who recommended that method....may have been Steve). Worked out well for me. Also have used the "Doofus" and that worked out well also.

Otherwise I used a Hakko 936 with the their smallest tip at 700 degs and RShack .015" solder. My 70 year old eyes needed as much "lighted" magnification as I could find, both bench fixed and handheld.

A Great rig and in my opinion and the only one for Spartan Sprint and that's all I use it for. Great design Steve, carry on the good work. BTW, I have also built a K2, K1 and a KX-1.

One of these days I'll get round to using W1MT's firmware.

From: andrew.macallister@emersonprocess.com
Topic: 1577 Message: 1621

Just a few more comments on my experiences...

I actually just use a fine-point dental pick (cheap at hamfests - made in India) to get whatever micro-thingie in place and hold it for the initial tack solder job on one pin or side. I then finish out the other lead or leads, and then revisit the initial tack point for good flow. Most of the time I wear headgear magnifiers (cheap from lots of places), and use the desk magnifier, in addition to the headgear, for those nano/pico leads on the impossible chip. The work area is a large sheet of white paper with some edges turned up to capture escaping electro-critters. So far, so good.

I used to use the ATS-3 rigs only for the Spartan Sprint, but now have found them to be my preferred rig for lots of other QRP endeavors. I don't know if I can get the 3B lighter than my 2 oz 3A (batteries, keyer paddle and earbuds included), but I will give it a try!

Hey Dave and the gang;

I have been using blu-tack for holding the larger and/or many legged devices. I got the idea from a posting on another email reflector years ago.

But the beeswax idea appeals to me as the solvents I do my final board cleaning with should probably take care of any residue nicely.

With the blu-tack I end up removing it by rolling it back up shortly after the soldering is done, so I have to be careful where I use it, which is generally around the ends only.

Thanks for the great info !!

Vy 72;

Bob
w9ya

P.S.... The very best tweezers are NOT some particular brand or model someone else recommends, but rather the ones that *you* will not go flinging parts around the room with. And I am beginning to believe that the tweezers are an incredibly personal choice as not everyone has the same kind of fine-motor skills.

Personally I like ones where the tips are so fine I have to realign them form time to time because I am bending them out of shape. I get the best holding from those kinds of tips. YMMV of course.

Nope. I have the back side of the board almost ready for soldering.
I am having a little trouble with the errors in the manual. But I have
it figured out but wasted a lot of time!

But if the back side solders good the whole thing will be done
Saturday if I can find time. My shaky hands are doing ok with this
method and I have 3 twezzers.

Topic: 1631 Message: 1631

It's that time of year, again! Time for the Fall edition of the NJQRP Homebrewer Sprint. It will be held this Sunday night (Monday morning UTC time). So put on your headphones, grab your key and come join us for a spell. Work a half-hour, work an hour, work all four! The point is to join in and have some fun!

This time, however, this will be a CW ONLY event, due to the lack of PSK-31 entries.

Mission: Promote homebrewed & homemade equipment on the air together. Kits are considered homebrew. Anyone with ANY equipment can enter; and is highly encouraged to do so!

Sponsor: New Jersey QRP Club (http://www.njqrp.org)

When: The fourth Monday in March and in September, 0000-0400 UTC (Sunday evening in USA/Canada)

Modes: CW only, starting this edition, QRP friendly frequencies recommended on 80, 40, 20, 15 and 10 meters.

Exchange: RST - State/Province/Country - Power out

QSO Points:
2 Commercial Equipment
3 Homebrew Xmtr or Rcvr
4 Homebrew Xmtr AND Rcvr or Xcvr
(Kits are okay for homebrew)

Power Mult: The highest power used during the contest determines the multiplier ...
a) >5W = X1
b) >1-5W = X7
c) >250mW - 1W = X10
d) 250mW or less = X15

Multiplier: State/Province/Country for all bands. The same station may be worked on more than one band for QSO points and SPC credit.

SCORE: Points(total for all bands)
x SPC (total for all bands)
x power multiplier.

Awards: Awards: Special certificates will be awarded.

Results: Sprint results will be published on the NJQRP Web pages

Logs: Entries must be received by 30 days from the contest. The log sheets and summary should be included. E-mail logs are accepted in text form. (No word processor files etc). Also paper logs are ok. Include an SASE or E-mail address for the results, if desired. Please include your Soapbox info with your equipment and exploits.

Send logs to:

Larry Makoski, W2LJ
327 Clinton Place
South Plainfield, NJ 07080

or send by email to w2lj@...

W5ESE Scott 168 pts
VE3HUR Don 112 pts

Soapbox:

I didn't hear much except static crashes - no AGC isn't nice on the eardrums! - VE3HUR

Where was the activity??? Quit after the first two hours for lack of anyone to work. - N4BP

I set up my DSWs and listened for the first half hour on 40 and 80. I didn't hear anyone playing! So I quit. Then I thought, " I can't quit." So I listened on 40 with the FT-900. There was Bob, N4BP. The only player. I worked him and quit again. Then I listened again an hour later. 40 was very dead. But Bob had moved to 80 and I worked him there. Then I picked up Bill AB1AV and KG4W in VA. So I quit this sprint 3 times. - W1PID

Thanks for a fun contest. But where did everyone go after 0200Z??? I guess conditions really went downhill after that, but tried to keep going right to the end. Big surprise was WB8LZG, who I was sure was QRO, he was so loud. Really enjoyed getting a 119 from Bulgaria! - KR1S

My 20m antenna isn't the greatest so I decided to fire up on 40m. I was hoping I'd find enough Qs there to keep me somewhat busy. However, that didn't turn out to be the case. Since I didn't have 80m in the K1, I decided to stick it out there on 40 for a bit but the sparce activity continued. I never did get to work any west coast stations. I heard K7TQ work N4BP but then he disappeared. Anyway, I thank the sponsor for this event and the opportunity to
work other homebrewers and play radio. - K8KFJ

Participation seemed light, or perhaps propagation only covered the East Coast. N4BP was loud as usual, but KD2MX was really booming in. Maybe I'm not a contester, since I quit at bedtime, but I was glad to catch this sprint. - AB1AV

This is my entry for the HB Sprint on Sunday night 3-25-07. This is my 1st effort in the event.
- KG4W

The bands were very noisy and I lost a couple of potential QSOs in the QRN. Seemed like activity was way off from last year or conditions were worse then they seemed as QSOs were few and far between. - KD2MX

Very gud signals on the band tonight. W4QO was booming into Michigan with just 400mw ! WOW ! Great signal. Band went long abt 0130 Z here. Lots of fun es a gud turnout. - WB8LZG

Thanks alot for sponsoring the event. Didn't hear much activity, but decided to send in a log anyway. - W5ESE

1632. I'll never clip the leads of a through-hole part again!!!

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-22 03:34:19 UTC
From: John Shadle
Topic: 1632 Message: 1632

OK. So, I just successfully completed the NorCal dummy load to practice SMD soldering and...what can I say? I'm hooked!

I'm selling my vise, I'm throwing away my wire cutters, and I'm tossing out any solder larger than .015"!

(So, I'm only halfway joking.)

I want to get one more SMD practice project under my belt before I tackle my QBSA and ATS-3B, but completing the NorCal Dummy Load sure boosted my confidence. :)

Why was I so afraid of this?

My technique was to tin one of the pads, place the part with tweezers, use the "doofus" to hold down the part while I warmed the tinned pad, removed the "doofus", then finished by soldering the other pad. Voila!

Thanks for all the tips, guys. Can't wait to move on to better things!

'night.

Most problem Bruce is with the tiny 3 and 4 legged IC's. The color is
the only thing to use but I find a large? Green colored chip carrier has
a 4 leg chip and the spot on the board is for a 3 leg. Stuff like that.
It makes it VERY slow going.

From: Dave
Topic: 1617 Message: 1634

> Green colored chip carrier has
> a 4 leg chip and the spot on the board is for a 3 leg.

Uh, there are no 4-lead SMT parts that I know of in the kit other than the oscillator (unless you count the heat-sink tab on the regulators and Q6). If you are referring to U11 on the bottom of the board (not to be confused with U11 on the top, the oscillator), it's a three-terminal SOT-23 device.

Dave, WA3OFF

1635. Consolidated manual corrections?

Is there a list, or document somewhere with all the manual/schematic corrections for the 3B? I"m itchin' to get started!

John K5MO

1636. Straight key operation lost after "E"

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-22 13:58:21 UTC
From: Dave
Topic: 1636 Message: 1636

The present version of the 3B code forgets that it is in straight-key mode if the overcurrent protection trips. The straight-key mode bit FL_STRKEY is in the "flags" word which gets cleared. I'm not entirely sure that there aren't other things that are not retained, like DDS settings; the audio seems to sound different after hitting the Menu button after the trip.

Hi Dave, no my problem I see now is that there are TWO Orange and Green devices. One is small and the other is large. I looked at the picture of the one Steve made and I *THINK* I might have the right ones selected now hope hope.

It is all changeable because I have not soldered the bottom yet. Trying to get it right :-)

And yes 2 U11 do confuse old men too.

1638. Stereo jacks not as sturdy...

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-22 14:07:37 UTC
From: Dave
Topic: 1638 Message: 1638

... as the ones that came with my 3A. I have one that the back pops out of when I insert the plug (I did, however, desolder and reinstall both of these jacks, so perhaps it just doesn't tolerate that as well). You might consider switching back to your previous source for future kits; those were quite nice.

1640. Cash Olsen method

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-22 23:52:20 UTC
From: Karl Larsen
Topic: 1640 Message: 1640

Hi guys, I lost the diode trying to open the dam package! I was trying to get my tweezer into the package and get the TINY diode out but it went airborn. Only thing so far so will be more careful.

I cooked the back side of the board and it looks great! But I had some errors. A couple of devices didn't do right and I used 300% too much solder paste on two IC's and there are big solder bridges. I will fix this tomorrow as I can.

Even with the problems it's a good looking backside and it will work when fixed.

> other things that are not retained, like DDS settings

Actually, the settings are retained but the DDS's reset bit is not cleared when the Menu button is pressed. I think it gets cleared upon transmitting successfully, but I've changed the code in my 3B to clear the reset bit when the Menu button is pressed. This restores Rx operation. I've also changed the code to retain straight-key mode.

Wrong, Karl.

there will be no change in the Photo hosting on the Yahoo groups.
Read this notice at the top of every Yahoo Groups' Photos page:

Yahoo! Groups photos will NOT be affected by the closure of Yahoo!
Photos on September 20th. Yahoo! Groups photos will continue to work
as they do today.

I was there with my ATS-3A! Since this wasn't a Spartan Sprint, I ran heavy on the xmit for the first hour and only managed to make 10 Q's on 40M. Since I only have a pair of 200 maH LiPo's, I had to go to the charger for a while. When I came back, there was no one to be found. I was supposed to be soldering on my ATS-3B, but the lure of a contest overcame the urge...

Thanks, Karl.
This size of a project really tests the macro-focus of all our
cameras. You'd practically need a jeweler's camera, I suppose.
Thanks!
Jonathan

From: Dave
Topic: 1636 Message: 1652

Here are the code changes I made.

For straight-key:

```
clr &flags
```

becomes

```
bic.b #(~FL_STRKEY),flags
```

and

```
rst2: bit.b #PI_DAH
jc rst3
bis #FL_STRKEY,&flags
```

becomes

```
rst2: bic #FL_STRKEY,&flags
bit.b #PI_DAH
jc rst3
bis #FL_STRKEY,&flags
```

For the DDS reset:

```
ov_1: bit.b #PI_MENU
jnc ov_1
jmp wait1
```

becomes

```
ov_1: bit.b #PI_MENU
jnc ov_1
mov #02000h,r15 ;turn off DDS chip reset
call #out16
jmp wait1
```

Dave

From: mdgolfbum
Topic: 1655 Message: 1655

ATS-3: built in Altoids tin. No HW mods. Firmware is W1MT from 2006 Atlanticon. Can update to latest if desired.

Includes SMA-BNC cable for output, power connector to 9V snap, holder for 8 AA w/ 9V snap, power cable with PowerPoles.

Works good! $160 shipped.

Topic: 1656 Message: 1656

I have now proven that my 72 year old eyes both with plastic fix
focused lens will not make it. I tried to fix the solder job on the
AD9834 chip. For some reason, likely that I had too much solder laden
paste on that chip. But to be honest I can't really see the gray paste.
Anyway I reheated the board and got the AD9834 off and tried to hand
solder it. I have had great success on 2 ATS-3 kits. It just did not work.

I have everything in 4 Zip-Lock bags. They have all the hardware and
the cd-rom, all the resistors for the front of the board, all the
capacitors left for top and maybe for some other place, and the main
board with the AD9834 mounted wrong, and the AC02 chip and one resistor
loose in the bag.

I think anyone with a good iron and solder wick can fix the bottom
board in short order if they can see the components. I for sure can not.

For $100.00 I will mail you the whole kit as is. I want the money
via paypal or a check mailed to Karl Larsen, K5DI, 3310 East Street, Las
Cruces, NM 88005. Of course I need your address as well :-)

1660. QBSA enclosure ideas?

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-25 00:28:53 UTC
From: shadle
Topic: 1660 Message: 1660

Hi all,
I'm almost ready to begin building my ATS-3B, but am trying to get a little more SMD experience before I attack it. I know this is the ATS group, but...the QBSA is something that I'm guessing a lot of folks on this list have also built.

I finished the SMD parts for the QBSA last night and then started thinking about what I wanted to do with it when I was done.

What have you guys used as enclosures for the QBSA? I would love to see photos if you have them available.

Thanks!
-john W4PAH

Howdy John,
My QBSA enclosure... I guess I should build everything twice and throw the first iteration away. Anyway, here it is:
Without top http://farm2.static.flickr.com/1401/746305323_5b8ea5a89e_b.jpg
Dremelling the front panel
http://farm2.static.flickr.com/1396/746304195_3b44c3e5de_b.jpg

As you can see, my LED display is set too far back from the bodies of the two front PCB-mount pots. You have two pin configurations to choose from with the mounting of the front part of the chassis--and you can also set the freq readout 'deep' or by setting the pins just flush into the holes, which will allow a more attractive front panel. Mine looks too cobbled.
Anyway, my photos.
73, Jonathan

1663. 3B initial parts placement and soldering session

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-25 04:02:22 UTC
From: kc7fys
Topic: 1636 Message: 1663

I have to say, I'm sold on the Cash Olsen method--at least for some situations. I get a shiny, concave, and slightly matte solder joint. On the ICs, I'm super impressed. I never would be able to do this with my shaky iron--at least not with bigger solder blobs and more bridges. I do wonder if I'm not over-heating the parts, but I am conservative with the Hobby Lobby embossing tool and as soon as it flows I back off. I'm placing the other SMTs on the Front surface and getting ready to do that side. I'm worried that the parts will just fall off the other side, but there is probably not enough focussed heat and surface tension will probably hold things. I'm being as careful as I can; I just hope I'm not building a 1.1 oz paperweight!

One thing I learned, and I remember seeing diagrams on packages in Akihabara electronic parts shops: I would put a rope of solder paste _on_top_ of the IC pins next time, rather than right underneath. It seems like the flow and separate process would happen with fewer bridges.

1666. Hot plate

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-25 16:28:47 UTC
From: Kurt Savegnago
Topic: 1666 Message: 1666

Hey,

Has anyone tried a hot plate with the Cash Olsen
method? I have one available and I figure I could put
a
piece of sheet metal over the element and use a
thermometer to measure the surface temperature.
I figure if I can get the temp right (is it about
380F
or more?) I could get this to work. I haven't had the
time to start building the 3B yet but have a
DDR(digital defined radio) kit I was going to
sacrifice first.

1668. What's an "good" build time for an ATS rig?

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-25 16:37:00 UTC
From: Hank Greeb
Topic: 1656 Message: 1668

How long does it take for a person who is competent in the art of surface mount devices to put one of these together? I'm wavering on buying one to build, primarily because I've never built anything with surface mount. I have a couple "easier" kits to put together before I jump in. I hope to make a decision before the next round of kits is offered.

1669. Re: [AT_Sprint] Hot plate

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-25 16:42:02 UTC
From: Michael Harnage
Topic: 1666 Message: 1669

I used an old pan on the kitchen stove. Just got it hot enough to boil drops of water. I build my boards with longer bolts in the mounting holes (so the board stays level). Just place the board on the pan (it stands off the pan because of the bolts) for a few minutes then start the heat gun tills the solder turns shiney. Did the bottom of the board first then populated the top and did it. Two session on with the pan/heat gun. Worked like a charm. Remove a couple of bridges and it worked like a charm. One of my 0603 resistors got messed up, but it too, was an easy fix.

If I want to mess with keeping track of temperatures then I use my convection oven that I got just for electronics. Both methods work fine.

Topic: 1656 Message: 1670

Don't know if I qualify to called good at it, but it takes me about 2 hours to populate and solder the main board. (Hot air method). With a soldering iron it takes me about 4 hours. (But I don't use that method anymore.) My first ATS was an ATS-2 and it took me about 7-8 hours. So you can get faster with time.

I think Steve could beat me hot air times with his solder methods cause he knows where the parts go just by looking at them. :) I gotta use my 10x loupe to read some of the markings.

I built my ATS3 at work over my lunch hour in one week,
including winding the toroids and building the band boards,
so somewhere between 5-6 hours. This is with a pencil
iron, not hot air or oven methods.

Kurt it is clear you have not even seen the Cash Olsen web page. The warmer should be about 200 degree F. The embosing tool has the higher temperature. It is applied later.

I used to use one to do solder reflow and wetting tests.
It did exhibit one side being slightly hotter than the
other, but not remarkably so. I would probably do some
trial boards first to characterize it but it should work.
Buy yourself a cheap thermocouple (many DMM's have this
feature built in) and attach it to your subject board
with kapton tape. You can readily watch it approach
reflow temperature and know when to expect the solder to
go molten.

If it does not already have a fan (convection) then
you should add one but then it will cost even more.
The main problem with regular toaster oven is uneven
heat distribution. I like the tape idea and
thermocouple for monitoring. I would monitor the board
itself.

John,

Hope you're still following this. Please look at my pictures on this site (Photos) under KX0R, and you'll find three shots of my QBSA in a BLT case.

The QBSA was designed to fit in the BLT case, and it does fit - more or less exactly. The BLT is a QRP tuner unit sold by Doug Hendricks http://www.qrpkits.com/index.html . For a while he was selling the BLT enclosures separately, and I bought several when they were available. I ended up building several different homebrew versions of the BLT, and I still had one case left when I got my QBSA.

Maybe if you contact Doug Hendricks he would consider selling you a BLT case. I would buy more of them if he sold them again.

The hardest thing is getting the hole for the display in the right place. I'd suggest starting smaller than what you need and enlarging the hole with a flat file. I drilled a lot of holes to get a rough hole, and then filed out the opening while checking its position against the display. If you're good with files, you can get a pretty good rectangular hole just where you need it. Be careful and go easy, because with aluminum you can easily go too far.

As you see in my photos, I used a bunch of individual connectors for all the lines in and out. Some others here have suggested using fewer larger connectors - it's your call. There are advantages to both plans.

Mounting the QBSA and preparing the connectors and cables takes much longer than building the board.

The result is well worth the hassle, since it enhances the operation of the radio and provides several "big rig" features. Anyone who has the ATS rig (or other QRP rig) should consider getting a QBSA. This is a nice kit and well worth the price!

Howdy.
I'm winding up that 66-turn toroid, but the 7-turns that reside between the ends of the main winding--do I continue winding that wire in the same direction? That would put the leads on each end on opposite sides (top and bottom faces) of the toroid. Is this how it should look when it's done, or do I have the leads on the right on TOP of the toroid, and the leads on the left on UNDER the toroid?
Newbie question, I know.

Hi
The ATS3B arrived today and having looked at the parts I am wondering which order to solder in the components on the main board.
I am doing it by hand. Do I start with the chips, giving me plenty of room to work with desoldering braid, or do I leave the static sensitive chips to last?
Any advice from those who have done the construction would be most helpful.
U7 pin spacing looks tight!

Thanks

Doesn't really matter, as this is just a receiver coil, not an oscillator.
anyway you want to do it, so long as you can tell which winding is which,
because that does matter which set of holes they go in.

I will be starting mine shortly as well and I was wondering the same thing. Like you I was leaning towards installing the ICs first for the same reason you mentioned. Any tips from the experienced ATS hand-solder folks out there?

I just soldered up a touch keyer board which used surface mount parts. I had a heck of time trying to remove a solder bridge on one of the samll ICs using a desoldering braid. I finally tried my plastic solder sucker tool and it worked great.

1694. Superglue wrecked my paint job!

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-28 01:46:50 UTC
From: kc7fys
Topic: 1694 Message: 1694

Well, I used a gel-type Cyanoacrylate 'superglue' to tack the ends of windings to my toroids, and to hold them down to the band module board (80M). It melted the paint, and might have interacted weirdly with the enamel on the windings themselves. Just not a desirable effect, IMHO. I've seen snotty-looking hot glue used in this way, and I even envisioned a sort of plastic nuts-n-bolts dealy-bob on there, which would involve drilling and may be a bit of overkill. Either way, superglue won't be used on the rest of the toroids. I considered nothing at all, but that #32 wire just wouldn't hold up to much jarring, and the toroid'd be flappin' in the breeze before long.

>

Jonathan,

On my ATS-3A I used a few small dabs of 5-minute epoxy to secure the toroids. You're right - they need something to hold them. It really matters if you change bands often or use the rig in the field.

Another glue that's pretty safe for toroids is Duco Cement. It's similar to Q dope and airplane glue, and it dries fast. I think it's polystyrene, which is a good dielectric.

Silicone is useful for big toroids. It absorbs shocks, so it works better with large inductors. A plastic screw and washer provide a secure mounting also. It might work for the ATS modules, but it's tedious and doesn't flow well.

Use a minimum amount of glue. Too much might slightly reduce the Q of the inductors. On 20 meters my coils already get warm. A little dab will do yah - don't coat the windings - just a dab smaller than the head of a paper match, just between the toroid and the board, and no more than 2 dabs per toroid.

Looks like your gel superglue dissolves the paint on the toroids - hopefully that's not the insulation of the magnet wire as well.

Thanks for the excellent photos and keep those tips coming! I'm going to keep reading these posts for a while before I begin my ATS-3B.

1697. Hot Plate Tool

Yahoo group: AT_Sprint (2002 — 2008)
Date: 2007-09-28 03:51:05 UTC
From: radio_kx0r
Topic: 1697 Message: 1697

I think I may have found a low-cost way to create a low-tech hot-plate for the Cash Olson soldering method. When I was at Hobby Lobby buying my cute pink embossing gun (hot air tool), I found some nice little candle warmers. These miniature hot plates are rated at 15W at 120V. They cost all of $4 and even have a neon pilot light and a switch!

The candle warmer is intended to heat scented wax candles in glass containers so they can release their scent without actually burning. It is very similar to the cup warmers used by others, but the 15W is a little warmer than some of the cup warmers.

However, there is a problem. The candle warmer's hot surface is 3.6 inches in diameter, and it's recessed down about .12 inches, so the ATS-3B board won't quite fit or lie flat. It's also made of thin metal, and I don't believe it would provide even heat. Here's what I did to improve this tool:

I found a piece of .127" aluminum in my junk box and cut it into an octagon that will fit in the recessed "well" of the candle warmer. I chose a good flat piece and deburred it carefully. We want it to lie flat on the heater. Its top surface lies just a few thousandths above the plastic ring around the candle warmer - this is important.

I still needed a larger surface for the ATS-3B board. I found a piece of aluminum plate about .25" thick; it measures about 3.25" X 4.25". This is a little larger than we need for the board, but I figured it would be OK as long as it wasn't any larger.

The .127" thick aluminum octagon transfers the heat from the candle warmer surface to the thicker .25" aluminum plate, which sits on top and is a very efficient heat spreader.

I connected the candle warmer to a variac, set the aluminum spreaders in place, and let them warm up for 15 minutes. With 100 volts on the heater, drops of water bubble on the plate but don't boil. With 110-120 volts, the drops boil immediately, and best of all, the boiling is very uniform across the thick plate, even at the exposed corners.

With 130 volts, the water drops dance and spatter as they boil.

We may be able to run the voltage up even higher, if we really need a higher temperature - however, I think that the unit set up the way I have it may work fine. It does take a long time to reach thermal equilibrium, because of the thick aluminum, but there is no hot spot. Don't use a top plate much larger than the ATS board, or the temperature may not be high enough.

No - I haven't actually used it to solder with yet. I'm going to practice with it before attempting the kit. I move slowly, and I really want a good radio.

I just wanted you share these concepts in case some of you are looking for a pre-heater to combine with the hot air tool. It may be for sale at the same store - just smell around for those scented candles!

I'll post some photos soon.

I did feel pretty silly at the cash register with my pink embossing tool and my little candle warmer...the lady clerk was very kind...

Funny, my embossing tool was covered with snakeskin with wrought iron accents and spikes. Brand name: Captain Stag. My candle warmer--"The Boar Warrior." A chassis of cold-rolled extruded molybdenum steel, unpolished. The clerk lady--well, she gave me a knowing glance, a fingertip lingered at her throat, "Oh... goodness."

You can buy the entire series from their website:

PAST ISSUES & BONUS MATERIAL
We included issues 1-5 together to all subscribers as part of issue #5, and separately available previous issues for a given year in an annual collection (on a separately-purchased CD for issue #5, #10, #15, etc.), detailed sections on current Kits and past kits (aka "projects"), including all manuals, schematics, software, pcb layouts, etc. It's a great reference bank of technical homebrewing information. The last two issues, #6 and #7, are also separately still available.

From their website:

"Sorry, all CD-ROMs are out of print and are not available at this time."

Another great one fades into the past :-(

If the series is unavailable in print, and no longer provided on CD ROM from the AmQRP club, would someone inquire whether it would violate copyright to copy an existing CD and make it available again? I haven't seen the series myself, but if there's a demand I'd be willing to make copies from a legit copy and give the CD's back to AMQRP club at my cost, or sell them individually for a very reasonable price. I'd be doing this as a service to the QRPers. There might be others, who are "really" in business, who might like to do it as a part of their business.

I would suggest you contact George Heron, N2APB (n2apb@...)
about permission to do this.

Greetings,

Has anyone used the Fuchs antenna tuner design? If so, I am interested in what others have experienced using this tuner, whether it be from the German kit version or a homebuilt variety.

tnx es 72 - john - n0hj
